

ACSE-2

Part B  
Continuum mechanics  
and vector/tensor calculus

*Lecture 5*

Saskia Goes, s.goes@imperial.ac.uk, room 4.47

# Lecture Materials

- Lecture slides (gapped before, complete after lectures)
- Problem sets
- Solutions (after workshop)

On Box:

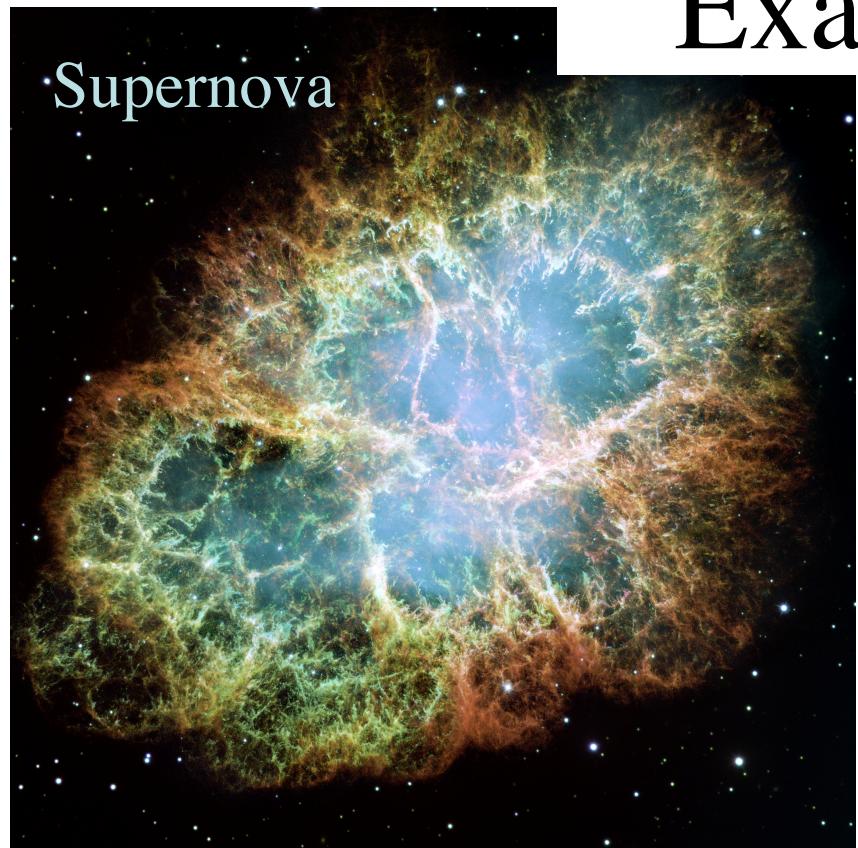

CourseMaterials-201920/ACSE-2 Lectures and Workshops

# Outline of course

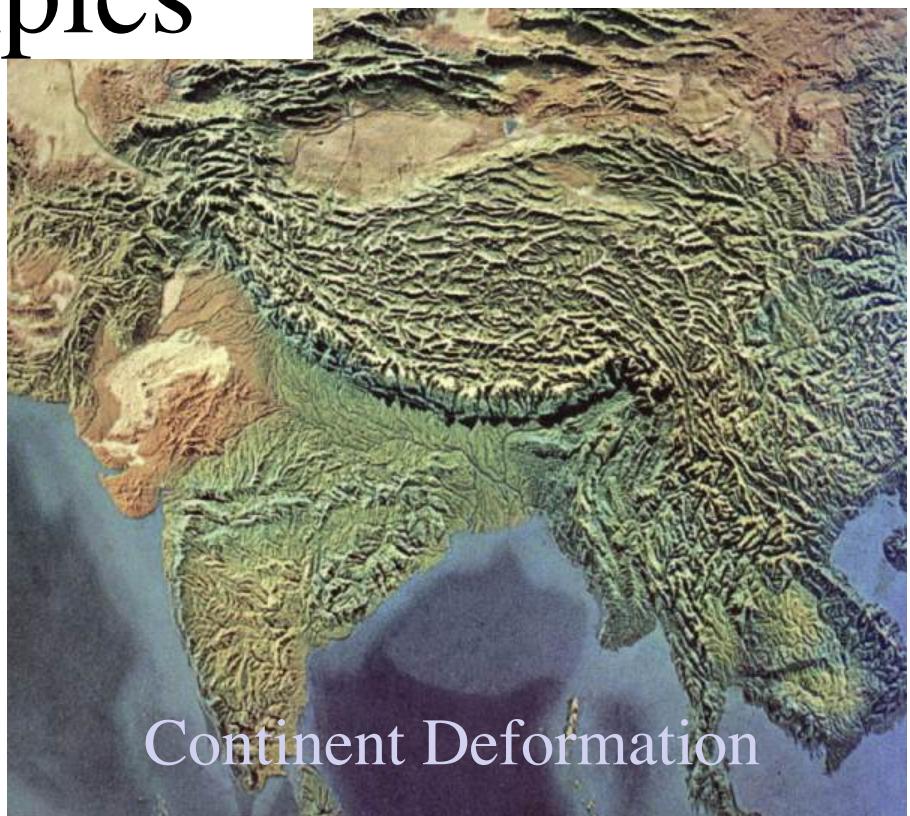

- 1. Mathematical essentials – *Matthew Piggott*
- 2. Linear Algebra I – *Matthew Piggott*
- 3. Linear Algebra II, ODEs – *Matthew Piggott*
- 4. Verifying models – *Matthew Piggott*
- 5. Vector and Tensor Calculus - *Saskia Goes*
- 6. Stress principles - *Saskia Goes*
- 7. Kinematics and strain - *Saskia Goes*
- 8. Rheology and conservation equations - *Saskia Goes*
- 9. Potential flow - *Stephen Neethling*
- 10. Fluid flow I - *Stephen Neethling*
- 11. Fluid flow II - *Stephen Neethling*
- 12. Wave propagation - *Adrian Umpleby*

# Continuum Mechanics

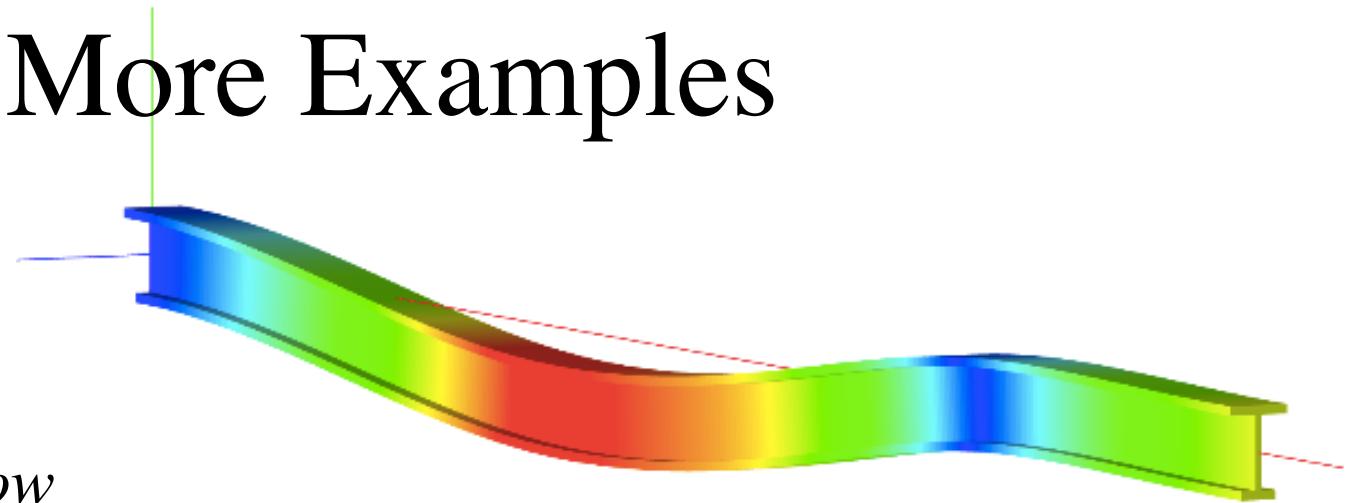

- *Macroscopic description* of the collective behavior of atoms/molecules in the limit where scale >> scale of the individual components
- Treat a material, be it solid, liquid, gas, as hypothetical continuum where all quantities vary continuously so that spatial derivatives exist
- In such a treatment, we can consider infinitesimally small volumes of the material and define point quantities, like mass, velocity, stress
- Such a description has been found to be applicable in a wide range of problems in engineering and physical sciences

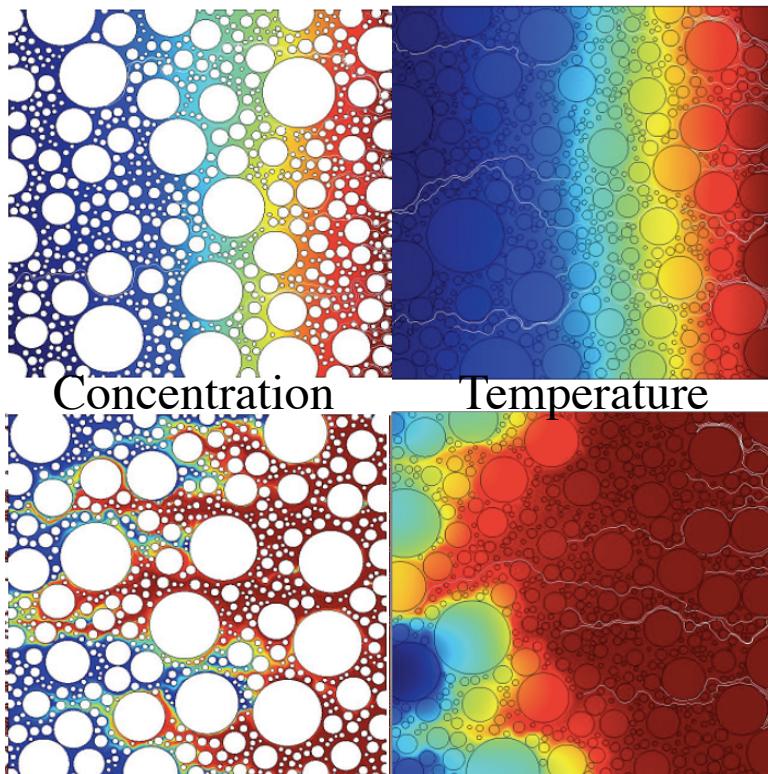

## Examples

# More Examples

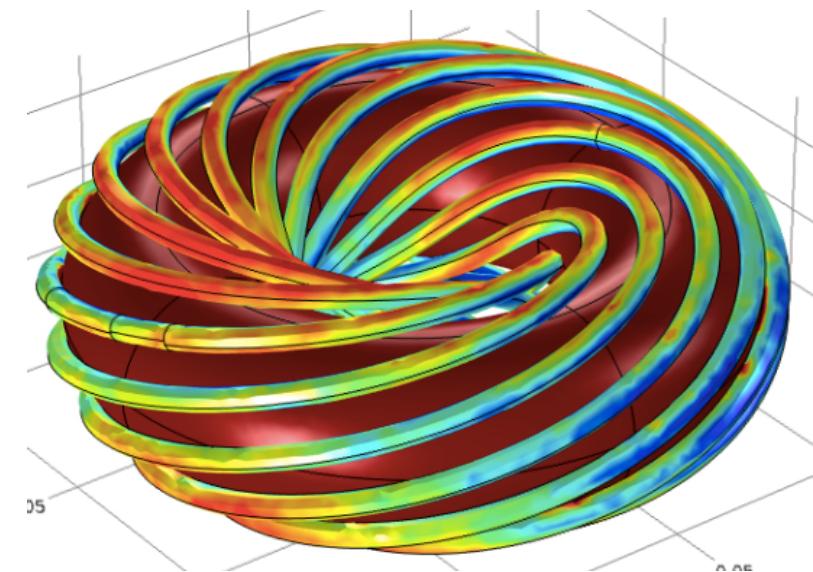

*Porous flow*

Concentration

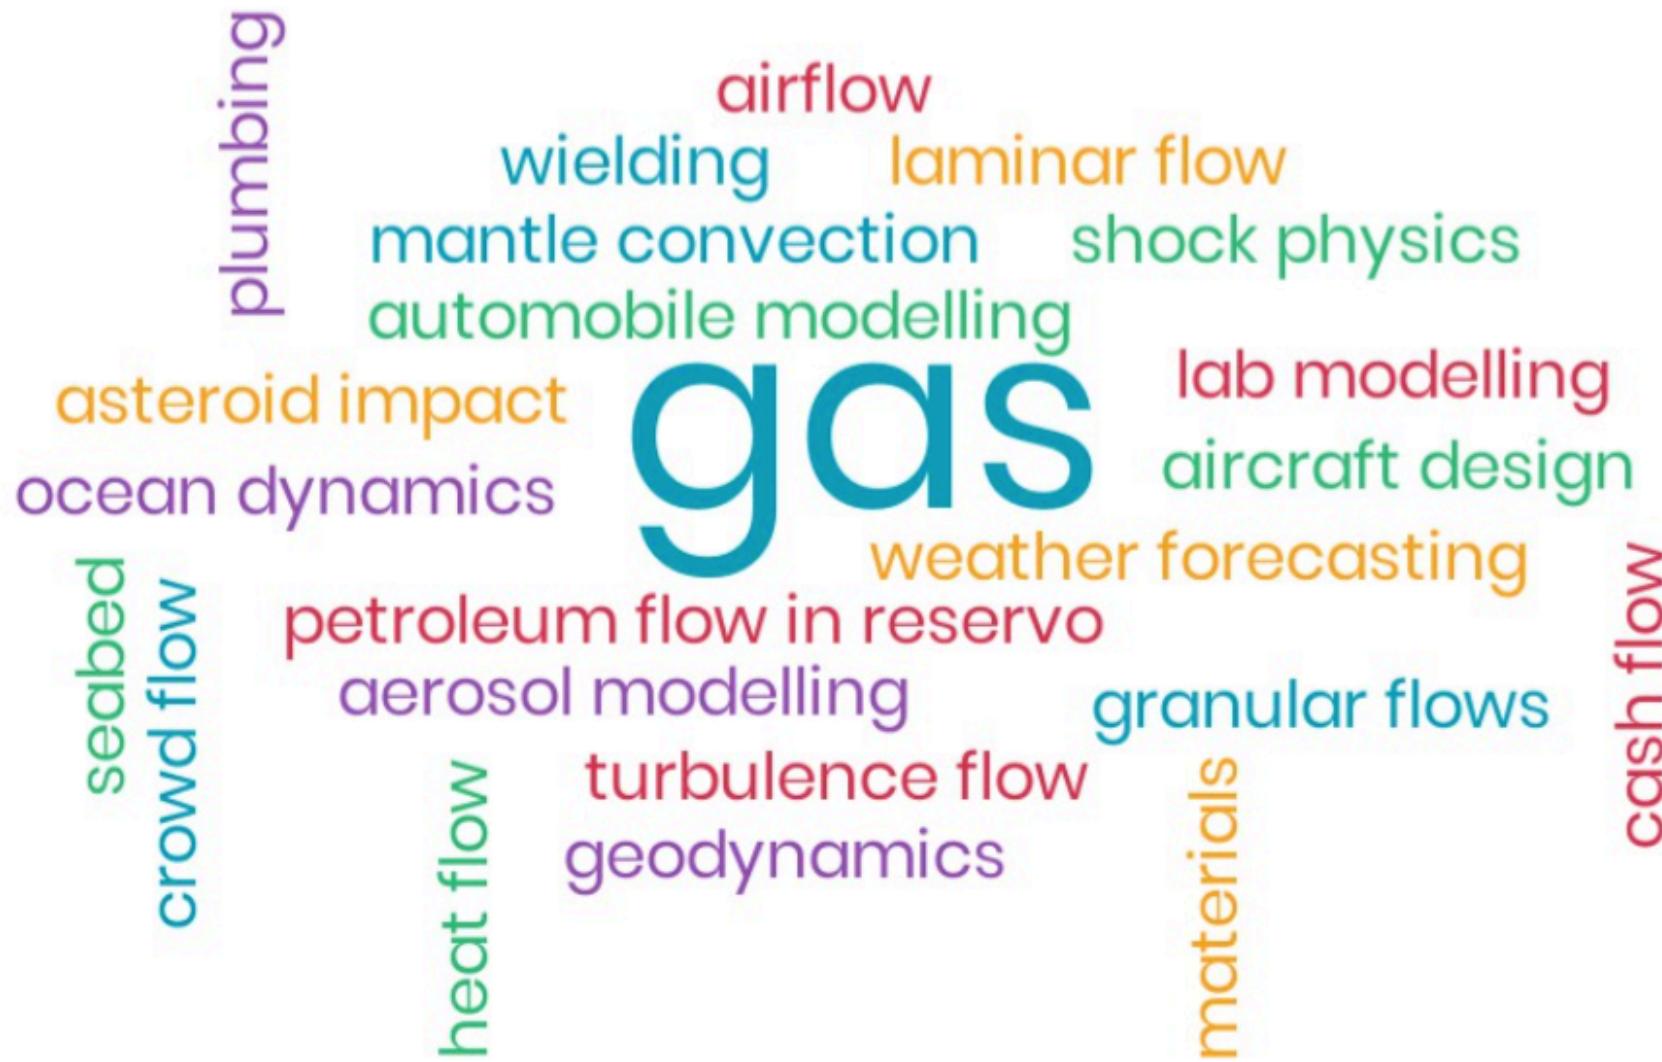

Temperature

*Beam bending*

*Electromagnetism*

# Other Examples?

# No required text

## *Possible textbooks for additional background*

- Introduction to Continuum Mechanics, W.M. Lai, D. Rubin, E. Krempl, 4<sup>th</sup> edition, Elsevier – available in electronic form through IC library
- An Introduction to Continuum Mechanics, J.N. Reddy, 2<sup>nd</sup> edition, Cambridge University Press, 2013
- Khan Academy – online lectures on Maths, Physics

*The books use similar notation as this course and cover many of the topics in ACSE-2. However, do note different reading may be suggested for other parts of the course*

# Continuum Mechanics Equations

## General:

1. Kinematics – describing deformation and velocity without considering forces
2. Dynamics – equations that describe force balance, conservation of linear and angular momentum
3. Thermodynamics – relations temperature, heatflux, stress, entropy

## Material-specific

4. Constitutive equations – relations describing how material properties vary as a function of T,P, stress,.... Such material properties govern dynamics (e.g., density), response to stress (viscosity, elastic parameters), heat transport (thermal conductivity, diffusivity)

# Continuum Mechanics Equations

## General:

1. Kinematics – describing deformation and velocity without considering forces
2. Dynamics – equations that describe force balance, conservation of linear and angular momentum
3. Thermodynamics – relations temperature, heatflux, stress, entropy

## Material-specific

4. Constitutive equations – relations describing how material properties vary as a function of T,P, stress,... Such material properties govern dynamics (e.g., density), response to stress (viscosity, elastic parameters), heat transport (thermal conductivity, diffusivity)

$\Rightarrow$  Yields a set of Partial Differential Equations that can be solved for displacement, velocity, temperature,...

# Partial Differential Equations

- **Ordinary Differential Equations** – describe how variables depend on a single independent parameter (e.g., time or distance).

For example:

$$m \frac{d^2x}{dt^2} = F$$

*Newton's  
second law*

- **Partial Differential Equations** – describe how variables depend on several independent parameters (e.g., time, x,y,z coordinates)

For example:

$$\frac{\partial T}{\partial t} = \kappa \frac{\partial^2 T}{\partial x^2}$$

*Diffusion  
equation*

$\partial$  - partial derivative

# Today

## Vectors and Tensors

- Revision vectors
  - Addition, linear independence
  - Orthonormal Cartesian bases, transformation
  - Multiplication
  - Derivatives, del, div, curl
- Revision/introduction tensors
  - Tensors, rank, stress tensor
  - Index notation, summation convention
  - Addition, multiplication
  - Special tensors,  $\delta_{ij}$  and  $\epsilon_{ijk}$
  - Tensor calculus: gradient, divergence, curl, ..

# Learning Objectives

- Be able to perform vector/tensor operations (addition, multiplication) on Cartesian orthonormal bases
- Be able to do basic vector/tensor calculus (time and space derivatives, divergence, curl of a vector field) on these bases.
- Perform transformation of a vector from one to another Cartesian basis.
- Understand differences/commonalities tensor and vector
- Use index notation and Einstein convention
- Be able to use the special tensors  $\delta_{ij}$  and  $\epsilon_{ijk}$

# Key characteristics of a vector?

1. Anything that is not a scalar
2. Has three components
3. Has magnitude and direction
4. Depends on coordinate frame
5. Velocity and rotation are two examples
6. Multiplication of two vectors gives another vector

Choose all that are correct

# Notation

- Vectors as  $\mathbf{v}$  or  $\vec{v}$  or  $\overline{v}$
- Length of vectors  $v$  or  $|\mathbf{v}|$
- Vector in Cartesian components  $v_x, v_y, v_z$
- Index notation  $v_i$ ,  $i=x,y,z$  or  $i=1,2,3$
- Unit vector along direction of  $\mathbf{v}$ :  $\hat{\mathbf{e}}_v = \frac{\mathbf{v}}{|\mathbf{v}|}$

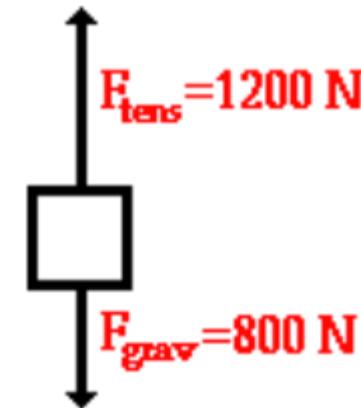

$$\mathbf{v} = \hat{\mathbf{e}}_v |\mathbf{v}|$$

# Vectors

Vectors satisfy certain rules of addition and scalar multiplication,

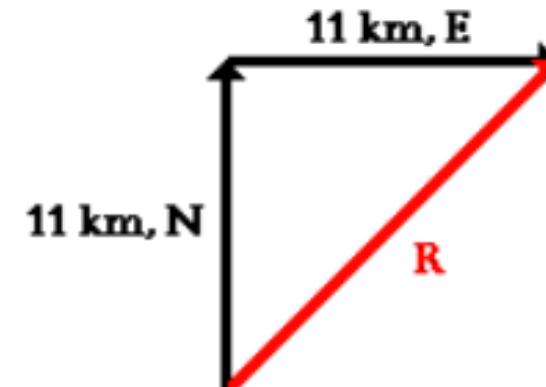

- $\mathbf{a}+\mathbf{b}=\mathbf{b}+\mathbf{a}$  (commutative)
- $(\mathbf{a}+\mathbf{b})+\mathbf{c}=\mathbf{a}+(\mathbf{b}+\mathbf{c})$  (associative)
- $\alpha(\mathbf{a}+\mathbf{b}) = \alpha\mathbf{a}+\alpha\mathbf{b}$  (distributive)
- $\mathbf{a}+\mathbf{0}=\mathbf{a}$  (zero vector)
- $1\cdot\mathbf{a}=\mathbf{a}\cdot 1; \mathbf{0}\cdot\mathbf{a}=\mathbf{0}$

$F_{\text{net}}$  is 400 N, up

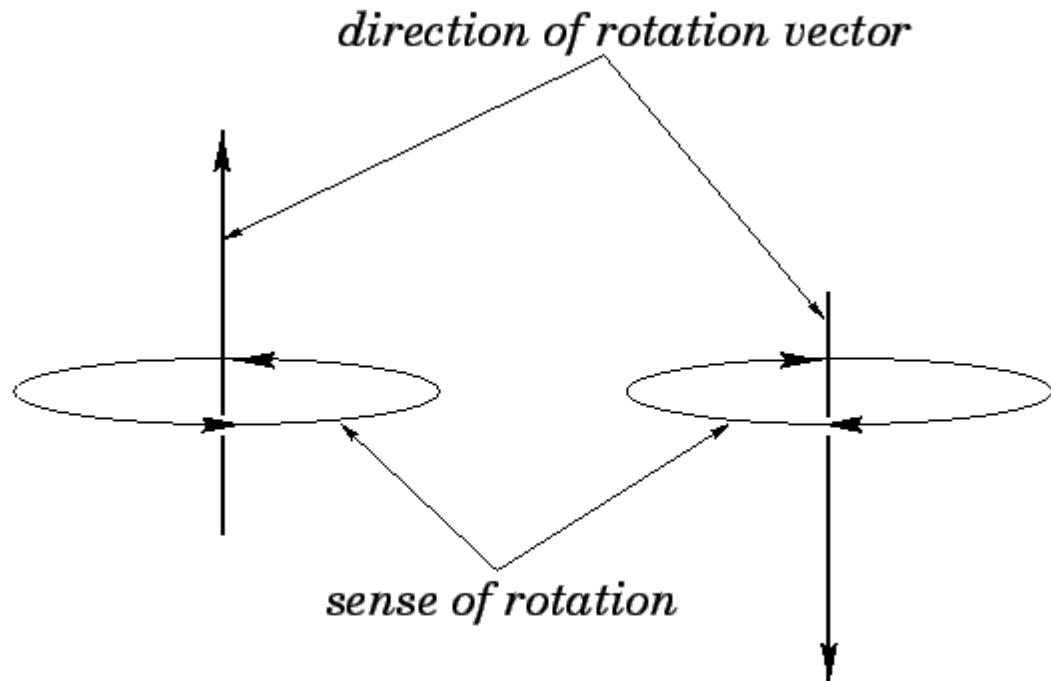

We will see that similar rules apply to tensors

$$\begin{array}{c} \uparrow \\ 11 \text{ km, N} \end{array} + \begin{array}{c} \longrightarrow \\ 11 \text{ km, E} \end{array} =$$

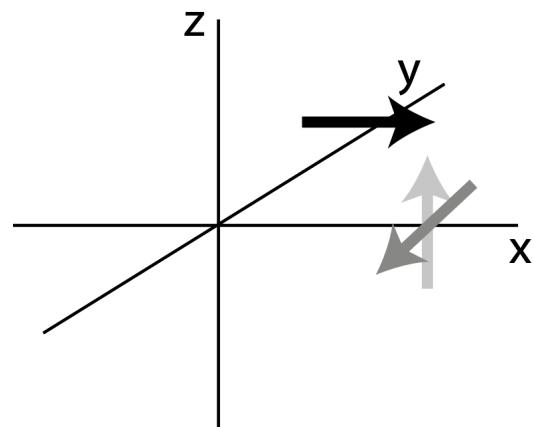

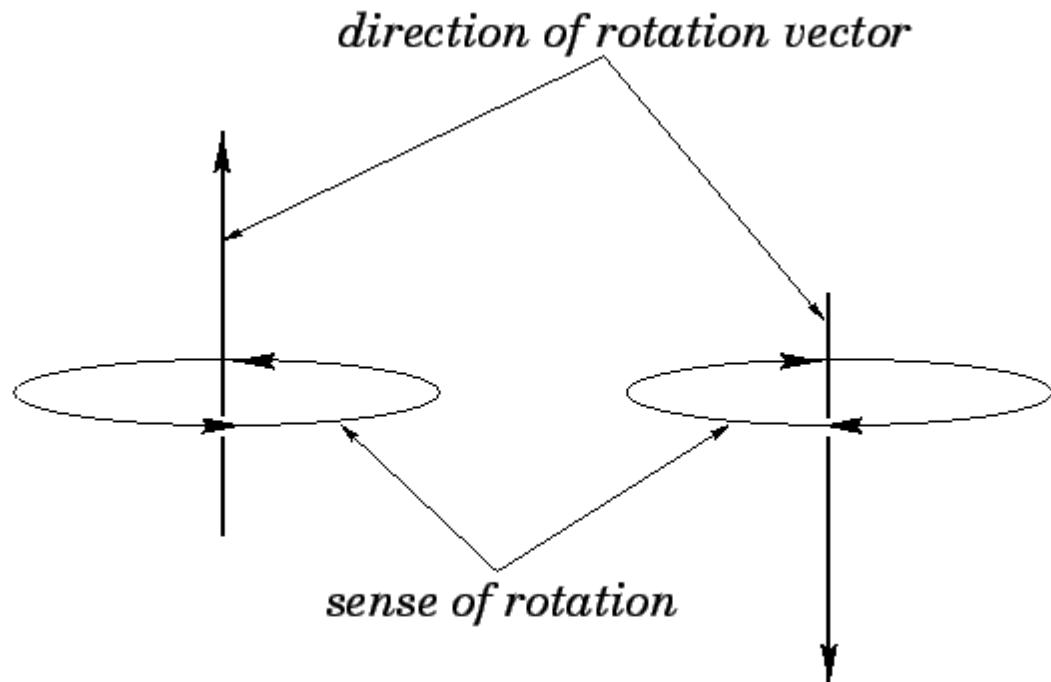

e.g. see <http://mathworld.wolfram.com/Vector.html>

# Finite Rotation “Vector”

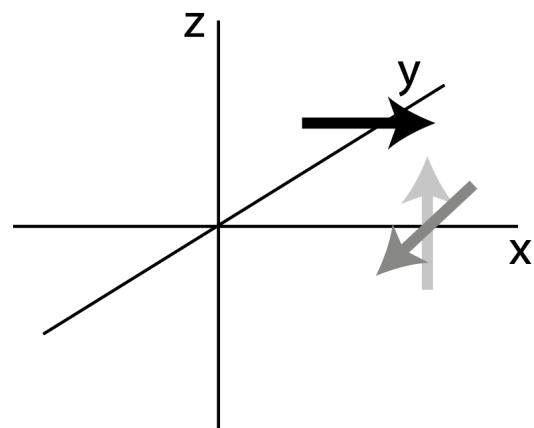

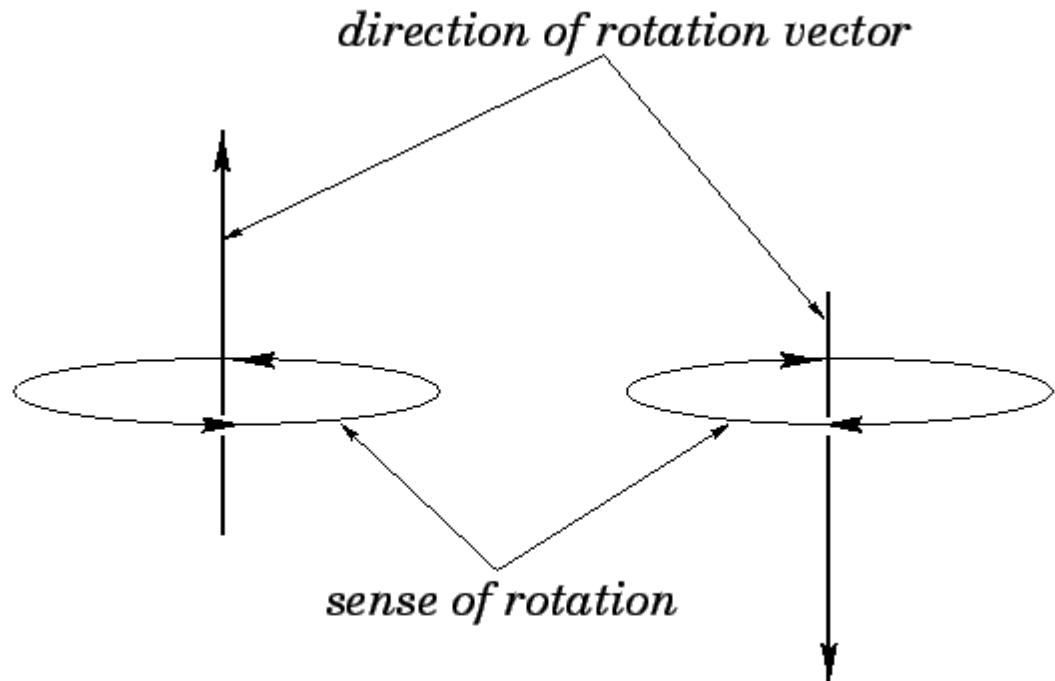

Right-hand rule

# Finite Rotation “Vector”

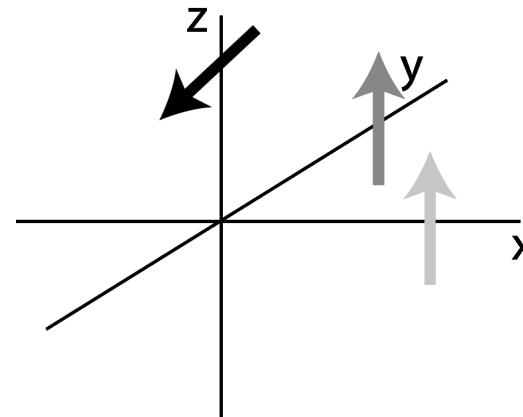

rotate  $90^\circ$  around **x** +  
 $90^\circ$  around **z**

# Finite Rotation “Vector”

rotate  $90^\circ$  around **x** +  
 $90^\circ$  around **z**

rotate  $90^\circ$  around **z** +  
 $90^\circ$  around **x**

# Linear independence

Vectors  $v_1$  through  $v_n$  are linearly dependent if coefficients  $c_i$  can be found such that:

$$c_1v_1 + c_2v_2 + c_3v_3 + \dots + c_nv_n = 0$$

1. if two vectors are linearly dependent, they are?
2. if three vectors are linearly dependent, they are?
3. four or more vectors are always linearly dependent

*Important for defining bases, independent solutions to a problem*

# Try yourself

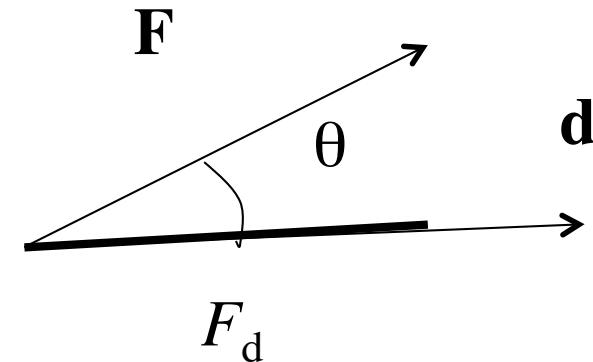

- *What steps would be required to determine in a code whether two given 2-D vectors  $\mathbf{a}$  and  $\mathbf{b}$  are linearly independent or not?  
Write them out.*

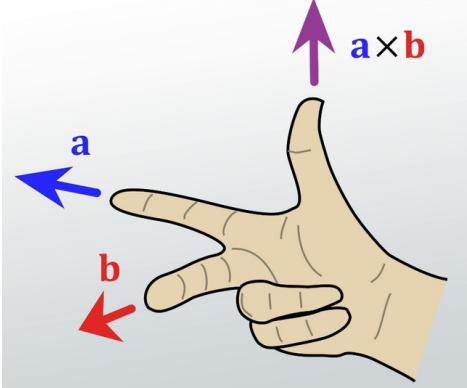

# Products of vectors

## Inner product, dot product, scalar product

### *Geometric definition*

- $\mathbf{F} \cdot \mathbf{d} = |\mathbf{F}| |\mathbf{d}| \cos \theta$ 
  - scalar,
  - projection of  $\mathbf{F}$  on  $\mathbf{d}$  times  $|\mathbf{d}|$ ,
  - = 0 if  $\mathbf{F}$  and  $\mathbf{d}$  perpendicular,
  - $\mathbf{F} \cdot \mathbf{d} = \mathbf{d} \cdot \mathbf{F}$
- If  $\mathbf{F}$  is force,  $\mathbf{d}$  is displacement, then  $\mathbf{F} \cdot \mathbf{d}$  is the work done by the force  $\mathbf{F}$  for displacement  $\mathbf{d}$
- $\mathbf{a} \cdot \mathbf{a} = \text{length}(\mathbf{a})^2 = |\mathbf{a}|^2$

# Products of vectors

## Cross product, vector product, outer product

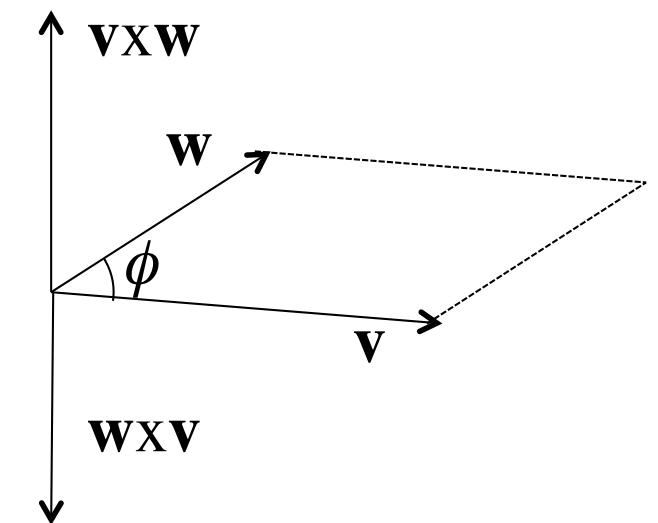

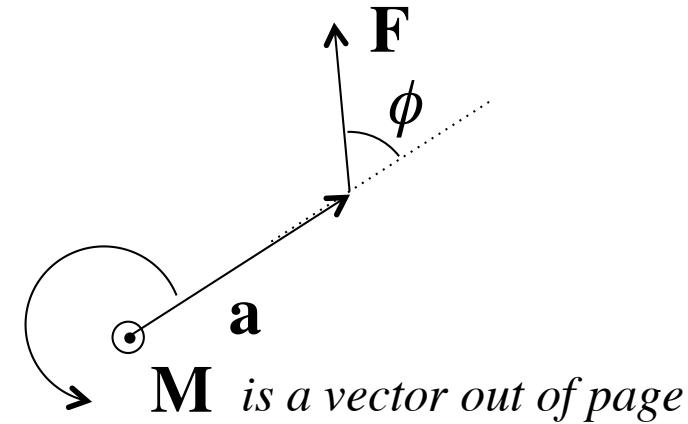

### *Geometric definition*

- Example moment:

$$\mathbf{M} = \mathbf{a} \times \mathbf{F} = aF \sin \phi \hat{\mathbf{e}}_M$$

- Properties  $\mathbf{v} \times \mathbf{w}$

- vector
- magnitude = area of parallelogram spanned by  $\mathbf{v}, \mathbf{w}$
- direction is that of plane normal (right-hand rule)
- $=0$  if  $\mathbf{v}$  and  $\mathbf{w}$  are parallel
- $\mathbf{v} \times \mathbf{w} = -\mathbf{w} \times \mathbf{v}$

# Products of vectors

Algebraic, in rectangular Cartesian coordinates:

**in 2D**

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 \quad \mathbf{v} \times \mathbf{w} = v_1 w_2 - v_2 w_1$$

**in 3D**

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 + v_3 w_3$$

$$\mathbf{v} \times \mathbf{w} = \begin{pmatrix} v_2 w_3 - v_3 w_2 \\ v_3 w_1 - v_1 w_3 \\ v_1 w_2 - v_2 w_1 \end{pmatrix}$$

# Rectangular Cartesian Coordinate System

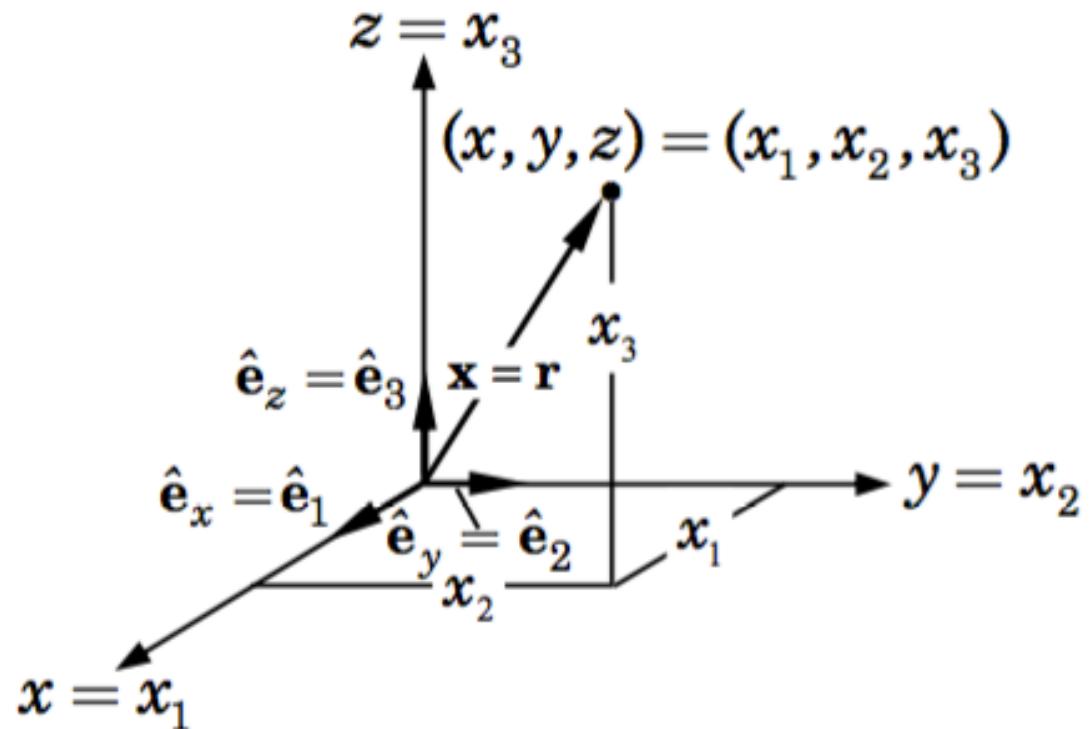

Orthonormal basis –

Basis vectors are:  
orthogonal

$$\hat{\mathbf{e}}_i \cdot \hat{\mathbf{e}}_j = 0 \quad \text{if } i \neq j$$

and unit length

$$\hat{\mathbf{e}}_i \cdot \hat{\mathbf{e}}_i = |\hat{\mathbf{e}}_i|^2 = 1$$

Cartesian – basis vectors with constant length and direction

In following, we will assume Cartesian orthonormal bases

Other orthonormal bases, e.g. polar or spherical, not discussed here

	Cartesian Coordinates	Cylindrical Coordinates	Spherical Coordinates
<b>Coordinate variables</b>	$x, y, z$	$r, \phi, z$	$R, \theta, \phi$
<b>Vector representation</b> $\mathbf{A} =$	$\hat{x}A_x + \hat{y}A_y + \hat{z}A_z$	$\hat{r}A_r + \hat{\phi}A_\phi + \hat{z}A_z$	$\hat{R}A_R + \hat{\theta}A_\theta + \hat{\phi}A_\phi$
<b>Magnitude of A</b> $ A  =$	$\sqrt{A_x^2 + A_y^2 + A_z^2}$	$\sqrt{A_r^2 + A_\phi^2 + A_z^2}$	$\sqrt{A_R^2 + A_\theta^2 + A_\phi^2}$
<b>Position vector</b> $\overrightarrow{OP_1} =$	$\hat{x}x_1 + \hat{y}y_1 + \hat{z}z_1,$ for $P(x_1, y_1, z_1)$	$\hat{r}r_1 + \hat{z}z_1,$ for $P(r_1, \phi_1, z_1)$	$\hat{R}R_1,$ for $P(R_1, \theta_1, \phi_1)$
<b>Base vectors properties</b>	$\hat{x} \cdot \hat{x} = \hat{y} \cdot \hat{y} = \hat{z} \cdot \hat{z} = 1$ $\hat{x} \cdot \hat{y} = \hat{y} \cdot \hat{z} = \hat{z} \cdot \hat{x} = 0$ $\hat{x} \times \hat{y} = \hat{z}$ $\hat{y} \times \hat{z} = \hat{x}$ $\hat{z} \times \hat{x} = \hat{y}$	$\hat{r} \cdot \hat{r} = \hat{\phi} \cdot \hat{\phi} = \hat{z} \cdot \hat{z} = 1$ $\hat{r} \cdot \hat{\phi} = \hat{\phi} \cdot \hat{z} = \hat{z} \cdot \hat{r} = 0$ $\hat{r} \times \hat{\phi} = \hat{z}$ $\hat{\phi} \times \hat{z} = \hat{r}$ $\hat{z} \times \hat{r} = \hat{\phi}$	$\hat{R} \cdot \hat{R} = \hat{\theta} \cdot \hat{\theta} = \hat{\phi} \cdot \hat{\phi} = 1$ $\hat{R} \cdot \hat{\theta} = \hat{\theta} \cdot \hat{\phi} = \hat{\phi} \cdot \hat{R} = 0$ $\hat{R} \times \hat{\theta} = \hat{\phi}$ $\hat{\theta} \times \hat{\phi} = \hat{R}$ $\hat{\phi} \times \hat{R} = \hat{\theta}$
<b>Dot product</b> $\mathbf{A} \cdot \mathbf{B} =$	$A_x B_x + A_y B_y + A_z B_z$	$A_r B_r + A_\phi B_\phi + A_z B_z$	$A_R B_R + A_\theta B_\theta + A_\phi B_\phi$
<b>Cross product</b> $\mathbf{A} \times \mathbf{B} =$	$\begin{vmatrix} \hat{x} & \hat{y} & \hat{z} \\ A_x & A_y & A_z \\ B_x & B_y & B_z \end{vmatrix}$	$\begin{vmatrix} \hat{r} & \hat{\phi} & \hat{z} \\ A_r & A_\phi & A_z \\ B_r & B_\phi & B_z \end{vmatrix}$	$\begin{vmatrix} \hat{R} & \hat{\theta} & \hat{\phi} \\ A_R & A_\theta & A_\phi \\ B_R & B_\theta & B_\phi \end{vmatrix}$
<b>Differential length</b> $d\mathbf{l} =$	$\hat{x} dx + \hat{y} dy + \hat{z} dz$	$\hat{r} dr + \hat{\phi} r d\phi + \hat{z} dz$	$\hat{R} dR + \hat{\theta} R d\theta + \hat{\phi} R \sin \theta d\phi$
<b>Differential surface areas</b>	$ds_x = \hat{x} dy dz$ $ds_y = \hat{y} dx dz$ $ds_z = \hat{z} dx dy$	$ds_r = \hat{r} r d\phi dz$ $ds_\phi = \hat{\phi} dr dz$ $ds_z = \hat{z} r dr d\phi$	$ds_R = \hat{R} R^2 \sin \theta d\theta d\phi$ $ds_\theta = \hat{\theta} R \sin \theta dR d\phi$ $ds_\phi = \hat{\phi} R dR d\theta$
<b>Differential volume</b> $dV =$	$dx dy dz$	$r dr d\phi dz$	$R^2 \sin \theta dR d\theta d\phi$

# Equivalence Cartesian geometric and algebraic dot product

$$\mathbf{a} = \sum_i a_i \hat{\mathbf{e}}_i \quad \mathbf{b} = \sum_i b_i \hat{\mathbf{e}}_i$$

$$\mathbf{a} \cdot \hat{\mathbf{e}}_i = |\mathbf{a}| |\hat{\mathbf{e}}_i| \cos \vartheta_i = |\mathbf{a}| \cos \vartheta_i = a_i$$

$$\mathbf{a} \cdot \mathbf{b} = \mathbf{a} \cdot \sum_i b_i \hat{\mathbf{e}}_i = \sum_i b_i (\mathbf{a} \cdot \hat{\mathbf{e}}_i) = \sum_i b_i a_i = \sum_i a_i b_i$$

# Products of vectors

Algebraic, in rectangular Cartesian coordinates:

**in 2D**

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 \quad \mathbf{v} \times \mathbf{w} = v_1 w_2 - v_2 w_1$$

**in 3D**

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 + v_3 w_3$$

$$\mathbf{v} \times \mathbf{w} = \begin{pmatrix} v_2 w_3 - v_3 w_2 \\ v_3 w_1 - v_1 w_3 \\ v_1 w_2 - v_2 w_1 \end{pmatrix}$$

# Cartesian algebraic cross product

$$\hat{\mathbf{e}}_1 \times \hat{\mathbf{e}}_2 = \hat{\mathbf{e}}_3 \quad \hat{\mathbf{e}}_2 \times \hat{\mathbf{e}}_1 = -\hat{\mathbf{e}}_3$$

$$\hat{\mathbf{e}}_i \times \hat{\mathbf{e}}_i = 0 \quad \hat{\mathbf{e}}_2 \times \hat{\mathbf{e}}_3 = \hat{\mathbf{e}}_1 \quad \hat{\mathbf{e}}_3 \times \hat{\mathbf{e}}_2 = -\hat{\mathbf{e}}_1$$

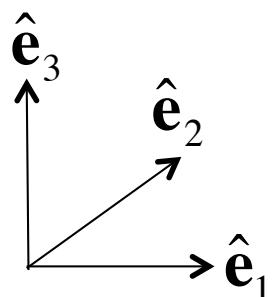

$$\hat{\mathbf{e}}_3 \times \hat{\mathbf{e}}_1 = \hat{\mathbf{e}}_2 \quad \hat{\mathbf{e}}_1 \times \hat{\mathbf{e}}_3 = -\hat{\mathbf{e}}_2$$

$$\mathbf{a} \times \mathbf{b} = (a_1 \hat{\mathbf{e}}_1 + a_2 \hat{\mathbf{e}}_2) \times (b_1 \hat{\mathbf{e}}_1 + b_2 \hat{\mathbf{e}}_2)$$

$$= a_1 b_1 (\hat{\mathbf{e}}_1 \times \hat{\mathbf{e}}_1) + a_1 b_2 (\hat{\mathbf{e}}_1 \times \hat{\mathbf{e}}_2)$$

$$+ a_2 b_1 (\hat{\mathbf{e}}_2 \times \hat{\mathbf{e}}_1) + a_2 b_2 (\hat{\mathbf{e}}_2 \times \hat{\mathbf{e}}_2)$$

$$= a_1 b_2 - a_2 b_1$$

# Products of vectors

Algebraic, in rectangular Cartesian coordinates:

**in 2D**

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 \quad \mathbf{v} \times \mathbf{w} = v_1 w_2 - v_2 w_1$$

**in 3D**

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 + v_3 w_3$$

$$\mathbf{v} \times \mathbf{w} = \begin{pmatrix} v_2 w_3 - v_3 w_2 \\ v_3 w_1 - v_1 w_3 \\ v_1 w_2 - v_2 w_1 \end{pmatrix}$$

# Triple products

- $\mathbf{a}(\mathbf{b} \cdot \mathbf{c})$  – vector times scalar
- scalar triple product  $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})$ 
  - $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c}$  – *show this*
  - $= \mathbf{c} \cdot (\mathbf{a} \times \mathbf{b}) = \mathbf{b} \cdot (\mathbf{c} \times \mathbf{a})$  (with cyclical permutation) – *show*
  - $= -\mathbf{a} \cdot (\mathbf{c} \times \mathbf{b}) = -\mathbf{c} \cdot (\mathbf{b} \times \mathbf{a}) = -\mathbf{b} \cdot (\mathbf{a} \times \mathbf{c})$  (with order changed) – *show*
  - $= 0$  if coplanar
- $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$  – lies in plane formed by  $\mathbf{b} \times \mathbf{c}$  and is normal to  $\mathbf{a}$ 
  - $\neq (\mathbf{a} \times \mathbf{b}) \times \mathbf{c}$
  - $= (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$

*Problem 5-3*

## Try now

- *How would you find components of a 3D vector  $a$  normal and parallel to 3D vector  $b$ ?*

## Try later

- *You could program this up and test with special cases*

# Vector transformation

- Vector magnitude and direction do not depend on basis
- When defined on orthonormal basis, like rectangular Cartesian, the transformation to other orthonormal bases is simple, with real coefficients.

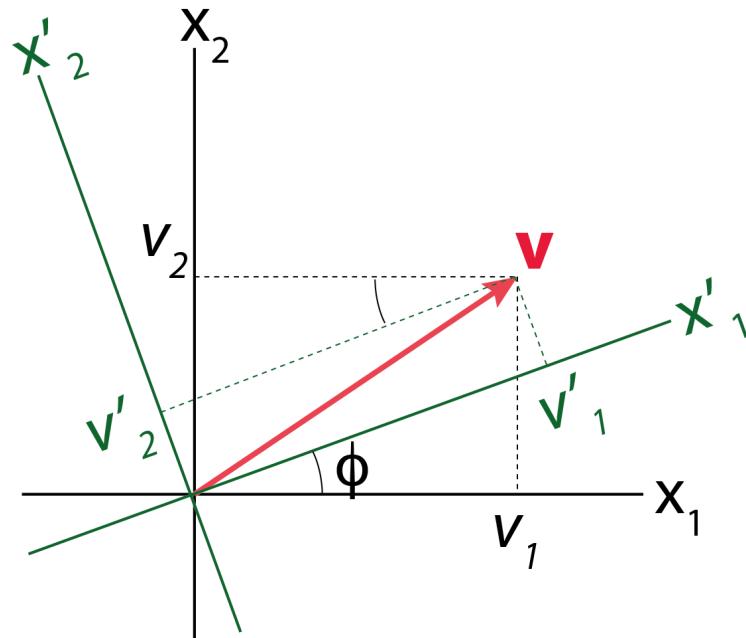

$$\hat{\mathbf{e}}_i \cdot \hat{\mathbf{e}}_j = 0 \quad \text{if } i \neq j$$

$$\hat{\mathbf{e}}_i \cdot \hat{\mathbf{e}}_i = |\hat{\mathbf{e}}_i|^2 = 1$$

*check out Khan Academy lectures on orthonormal bases*

# Vector transformation

physical parameters should not depend on coordinate frame

for vectors on **orthonormal** basis,  
transformed vector  $v'$  depends on  $v$ :

$$v'_1 = \alpha_{11}v_1 + \alpha_{12}v_2$$

$$v'_2 = \alpha_{21}v_1 + \alpha_{22}v_2$$

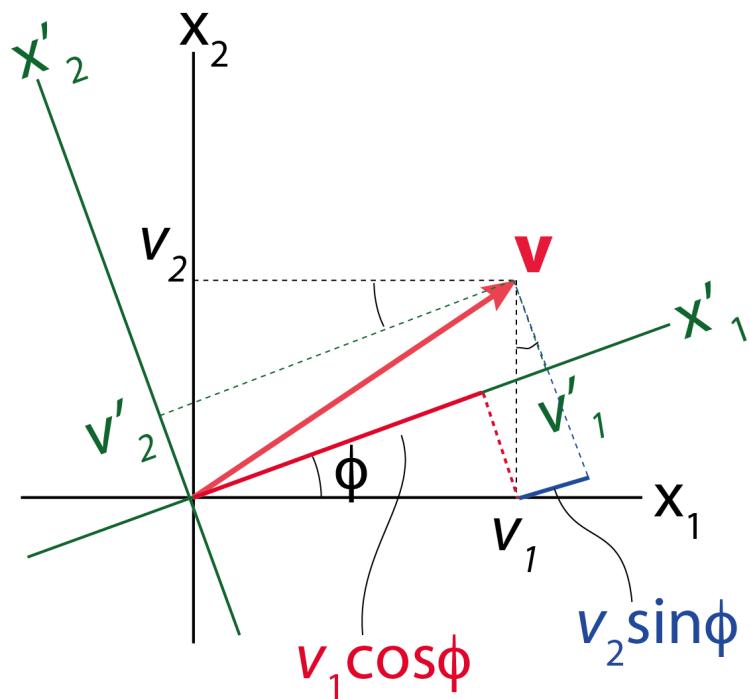

$$v'_1 = \cos\phi v_1 + \sin\phi v_2$$

$$v'_2 = -\sin\phi v_1 + \cos\phi v_2$$

coefficients  $\alpha_{ij}$  depend on angle  $\phi$  between  $x_1$  and  $x'_1$  (or  $x_2$  and  $x'_2$ )

# Vector transformation

physical parameters should not depend on coordinate frame

for vectors on **orthonormal** basis,  
transformed vector  $v'$  depends on  $v$ :

$$v'_1 = \alpha_{11}v_1 + \alpha_{12}v_2$$

$$v'_2 = \alpha_{21}v_1 + \alpha_{22}v_2$$

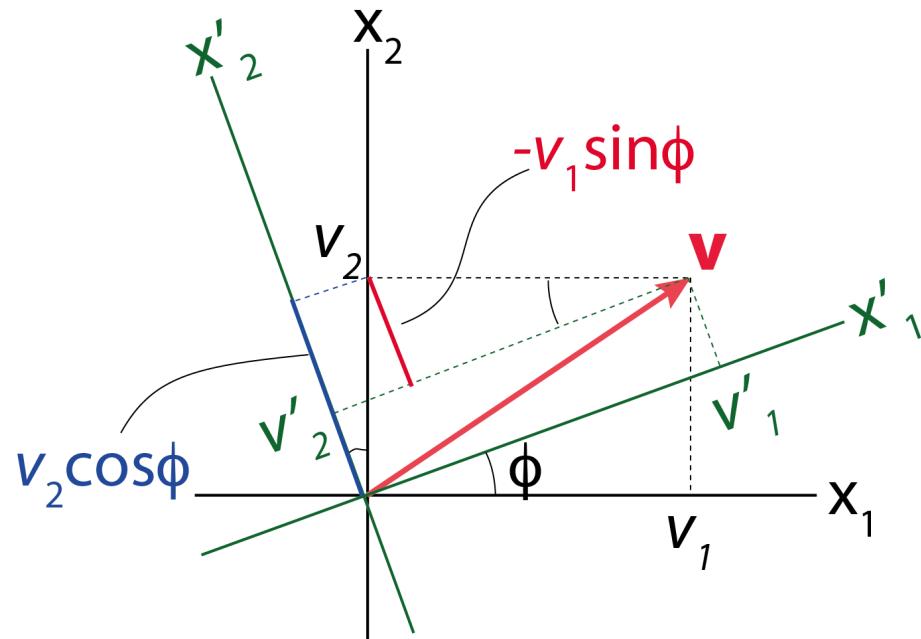

$$v'_1 = \cos\phi v_1 + \sin\phi v_2$$

$$v'_2 = -\sin\phi v_1 + \cos\phi v_2$$

coefficients  $\alpha_{ij}$  depend on angle  $\phi$  between  $x_1$  and  $x'_1$  (or  $x_2$  and  $x'_2$ )

# Vector transformation

physical parameters should not depend on coordinate frame

for vectors on **orthonormal** basis,  
transformed vector  $v'$  depends on  $v$ :

$$v'_1 = \alpha_{11}v_1 + \alpha_{12}v_2$$

$$v'_2 = \alpha_{21}v_1 + \alpha_{22}v_2$$

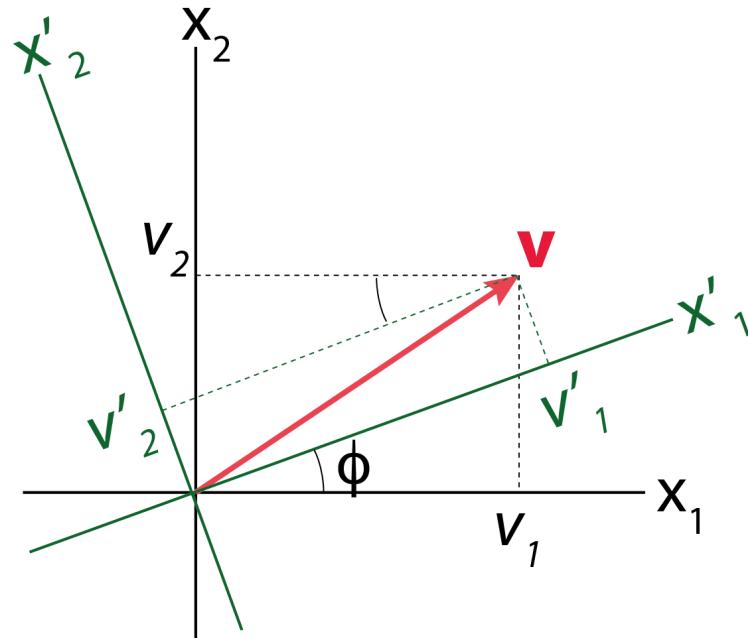

$$v'_1 = \cos \phi v_1 + \sin \phi v_2$$

$$v'_2 = -\sin \phi v_1 + \cos \phi v_2$$

coefficients  $\alpha_{ij}$  depend on angle  $\phi$  between  $x_1$  and  $x'_1$  (or  $x_2$  and  $x'_2$ )

# Vector transformation

physical parameters should not depend on coordinate frame

for vectors on **orthonormal** basis,  
transformed vector  $\mathbf{v}'$  depends on  $\mathbf{v}$ :

$$v'_1 = \alpha_{11}v_1 + \alpha_{12}v_2$$

$$v'_2 = \alpha_{21}v_1 + \alpha_{22}v_2$$

$$\rightarrow \mathbf{v}' = \begin{bmatrix} \alpha_{11} & \alpha_{12} \\ \alpha_{21} & \alpha_{22} \end{bmatrix} \mathbf{v}$$

coefficients  $\alpha_{ij}$  depend on angle  $\phi$  between  $x_1$  and  $x'_1$  (or  $x_2$  and  $x'_2$ )

$$\mathbf{v}' = \begin{bmatrix} \cos\phi & \sin\phi \\ -\sin\phi & \cos\phi \end{bmatrix} \mathbf{v}$$

$$\alpha_{11} = \hat{\mathbf{e}}'_1 \cdot \hat{\mathbf{e}}_1 \quad \alpha_{12} = \hat{\mathbf{e}}'_1 \cdot \hat{\mathbf{e}}_2$$

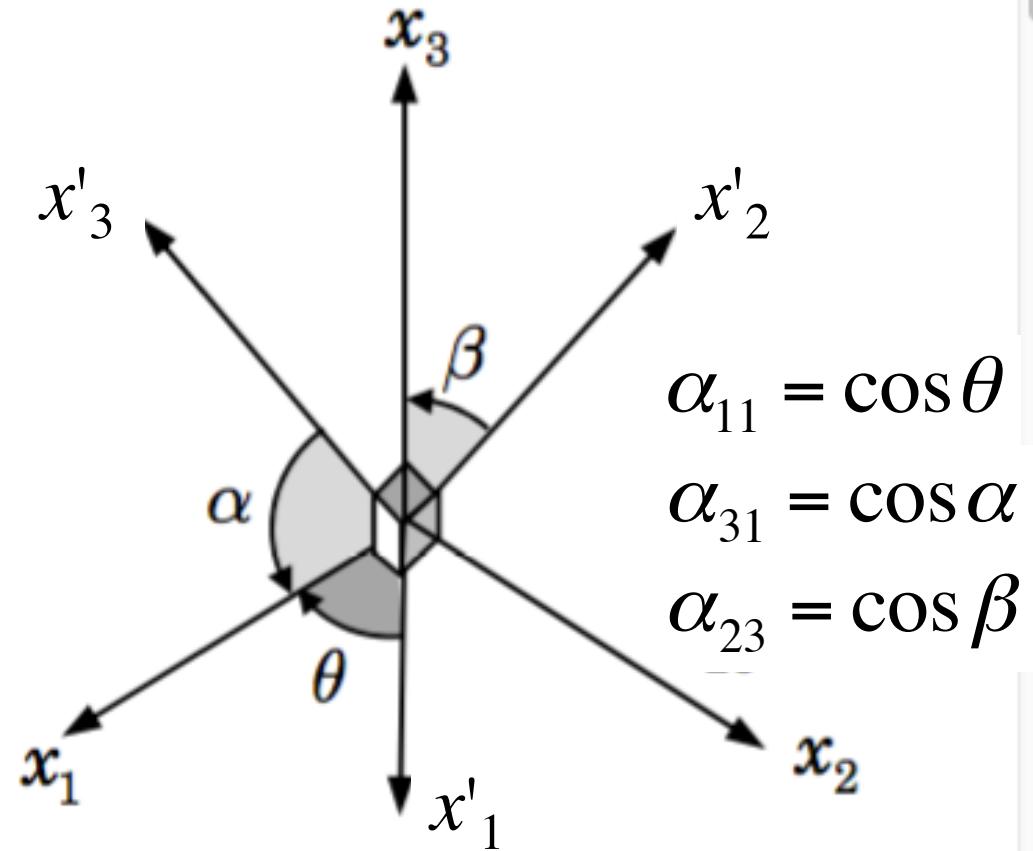

$$\alpha_{21} = \hat{\mathbf{e}}'_2 \cdot \hat{\mathbf{e}}_1 \quad \alpha_{22} = \hat{\mathbf{e}}'_2 \cdot \hat{\mathbf{e}}_2$$

# Transformation orthonormal bases

$$\hat{\mathbf{e}}'_i = \sum_{j=1,n} \alpha_{ij} \hat{\mathbf{e}}_j$$

In other words:

$$\alpha_{ij} = \hat{\mathbf{e}}'_i \cdot \hat{\mathbf{e}}_j$$

# Transformation orthonormal bases

$$\hat{\mathbf{e}}'_i = \sum_{j=1,n} \alpha_{ij} \hat{\mathbf{e}}_j$$

In other words:

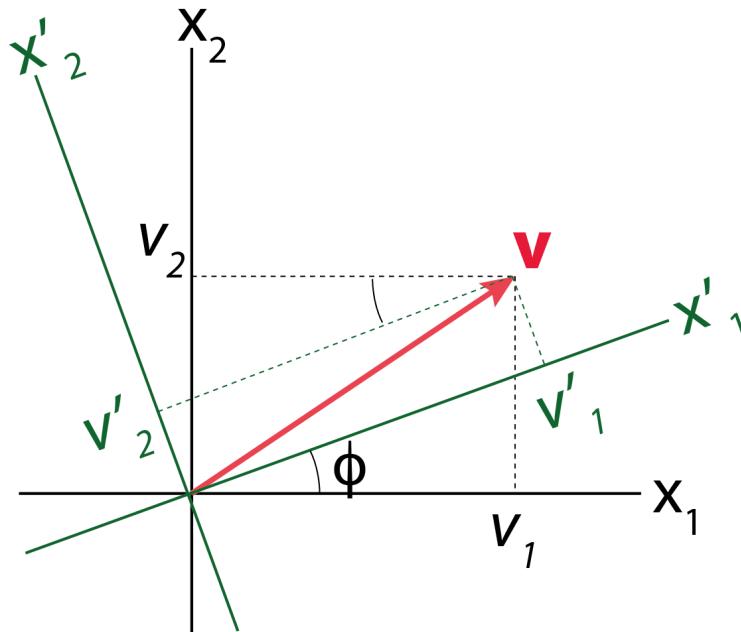

$$\alpha_{ij} = \hat{\mathbf{e}}'_i \cdot \hat{\mathbf{e}}_j$$

$$\mathbf{v}' = \begin{bmatrix} \cos\phi & \sin\phi \\ -\sin\phi & \cos\phi \end{bmatrix} \mathbf{v}$$

angle  $x'_2$  and  $x_1$

$$\mathbf{v}' = \begin{bmatrix} \cos\phi & \cos(90 - \phi) \\ \cos(90 + \phi) & \cos\phi \end{bmatrix} \mathbf{v}$$

angle  $x'_1$  and  $x_2$

# Vector derivatives

## Scalar: e.g. time

$$\frac{d\mathbf{v}}{dt} = \begin{pmatrix} \frac{dv_1}{dt} & \frac{dv_2}{dt} & \frac{dv_3}{dt} \end{pmatrix}$$

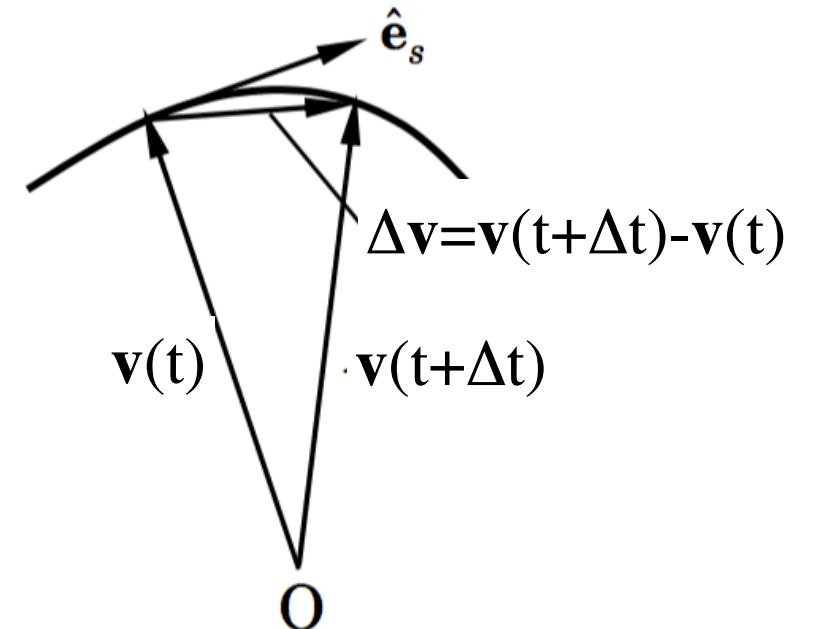

$$\frac{d\mathbf{v}}{dt} = \lim_{\Delta t \rightarrow 0} \frac{\mathbf{v}(t + \Delta t) - \mathbf{v}(t)}{\Delta t}$$

usually has a different direction than  $\mathbf{v}$

remember:  $\mathbf{v} = v_1 \hat{\mathbf{e}}_1 + v_2 \hat{\mathbf{e}}_2 + v_3 \hat{\mathbf{e}}_3$

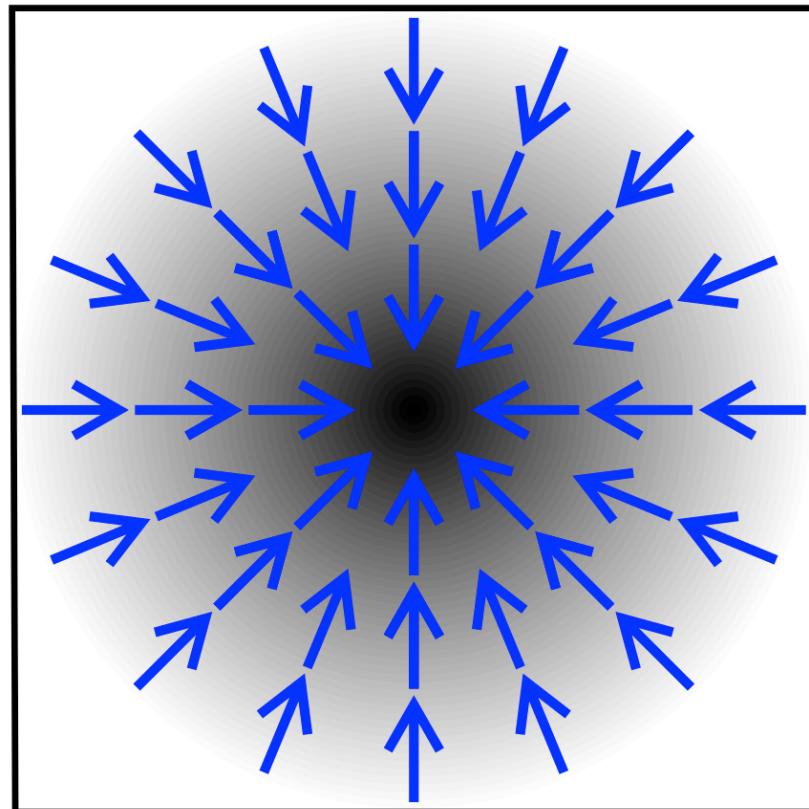

$$\frac{d\mathbf{v}}{dt} = \frac{dv_1}{dt} \hat{\mathbf{e}}_1 + \frac{dv_2}{dt} \hat{\mathbf{e}}_2 + \frac{dv_3}{dt} \hat{\mathbf{e}}_3 + v_1 \frac{d\hat{\mathbf{e}}_1}{dt} + v_2 \frac{d\hat{\mathbf{e}}_2}{dt} + v_3 \frac{d\hat{\mathbf{e}}_3}{dt}$$

↓  
for Cartesian systems = 0

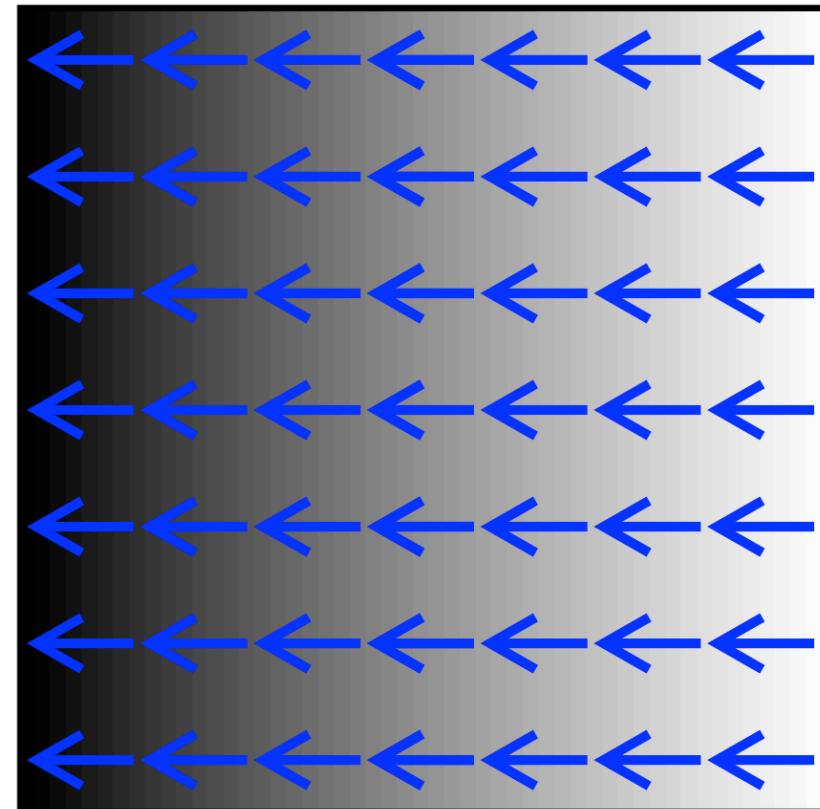

# Vector derivatives

## directional derivative: space

$\phi$  - high

$\phi$  - low

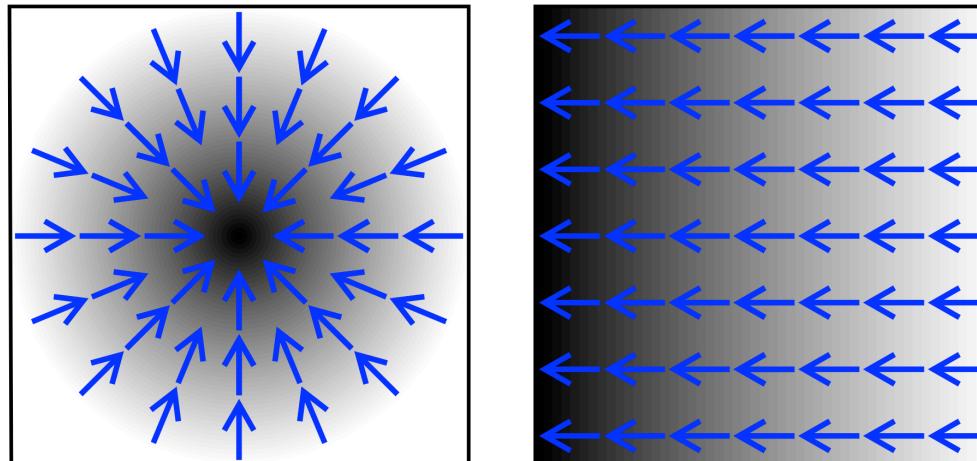

# Vector derivatives

## directional derivative: space

$\partial$  - partial derivative

$$d\phi = \frac{\partial \phi}{\partial x_1} dx_1 + \frac{\partial \phi}{\partial x_2} dx_2 + \frac{\partial \phi}{\partial x_3} dx_3$$

$$d\phi = \begin{pmatrix} \frac{\partial \phi}{\partial x_1} & \frac{\partial \phi}{\partial x_2} & \frac{\partial \phi}{\partial x_3} \end{pmatrix} \cdot \begin{pmatrix} dx_1 \\ dx_2 \\ dx_3 \end{pmatrix} = \nabla \phi \cdot \mathbf{dx}$$

Gradient  $\nabla \phi$ : vector that is a measure of change in scalar field with direction

# Try yourself later

- Define a scalar field, e.g.  $\phi(x,y)=x+2y$
- Determine values of  $\phi$  on a regular grid
- Make a contour plot of the field
- Numerically determine the gradient  $\nabla\phi$
- Plot the gradient components as contours, and compare with the analytical solution.
- Plot the gradient as vectors

# Del operator

$$\nabla = \hat{\mathbf{e}}_1 \frac{\partial}{\partial x_1} + \hat{\mathbf{e}}_2 \frac{\partial}{\partial x_2} + \hat{\mathbf{e}}_3 \frac{\partial}{\partial x_3} = \begin{pmatrix} \frac{\partial}{\partial x_1} & \frac{\partial}{\partial x_2} & \frac{\partial}{\partial x_3} \end{pmatrix}$$

Has some properties of a vector, but not all

$$\mathbf{v} \cdot \nabla \phi \neq (\nabla \cdot \mathbf{v})\phi$$

# Vector products with derivatives divergence, curl

- Divergence of a vector:  $\nabla \cdot \mathbf{v} = \sum_{i=1,3} \frac{\partial v_i}{\partial x_i} = \frac{\partial v_1}{\partial x_1} + \frac{\partial v_2}{\partial x_2} + \frac{\partial v_3}{\partial x_3}$

- Curl of a vector: 
$$\nabla \times \mathbf{v} = \begin{pmatrix} \frac{\partial v_3}{\partial x_2} - \frac{\partial v_2}{\partial x_3} \\ \frac{\partial v_1}{\partial x_3} - \frac{\partial v_3}{\partial x_1} \\ \frac{\partial v_2}{\partial x_1} - \frac{\partial v_1}{\partial x_2} \end{pmatrix}$$

# Useful calculus theorems

**Gauss or divergence theorem:**  $\int_V \nabla \cdot \mathbf{v} d\mathbf{x} = \oint_S \mathbf{v} \cdot \hat{\mathbf{n}} ds$

**Stokes or curl theorem:**  $\int_V \nabla \times \mathbf{v} d\mathbf{x} = \oint_S \mathbf{v} \cdot \hat{\mathbf{t}} ds$

Take volume  $V$  enclosed by a closed surface  $S$   
within a vector field  $\mathbf{v}$  with continuous partial derivatives

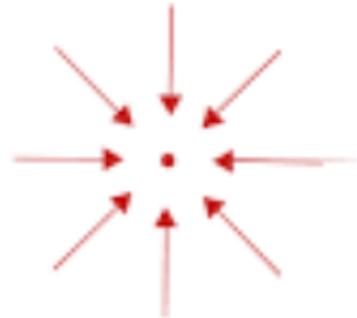

Flow perpendicular to the boundary:  $\mathbf{v} \cdot \hat{\mathbf{n}}$

Flow parallel to the boundary:  $\mathbf{v} \cdot \hat{\mathbf{t}}$

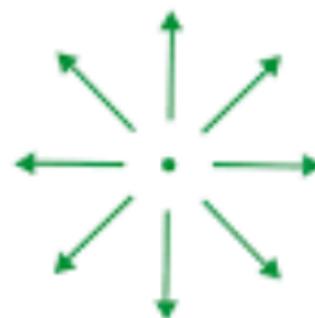

These can be used to simplify integration over volumes or  
closed surfaces as well as to gain understanding of the  
meaning of div and curl

# Divergence of a vector field

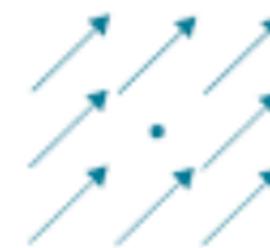

$$\nabla \cdot \vec{v} < 0$$

$$\nabla \cdot \vec{v} > 0$$

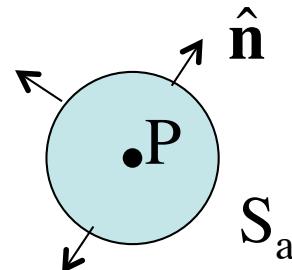

$$\nabla \cdot \vec{v} = 0$$

$$\int_V \nabla \cdot \mathbf{v} d\mathbf{x} = \oint_S \mathbf{v} \cdot \hat{\mathbf{n}} ds$$

Imagine a very small sphere, radius  $a$ , with boundary  $S_a$  around a point  $P$

$$(\nabla \cdot \mathbf{v})_P \frac{4}{3} \pi a^3 = \oint_{S_a} \mathbf{v} \cdot \hat{\mathbf{n}} ds$$

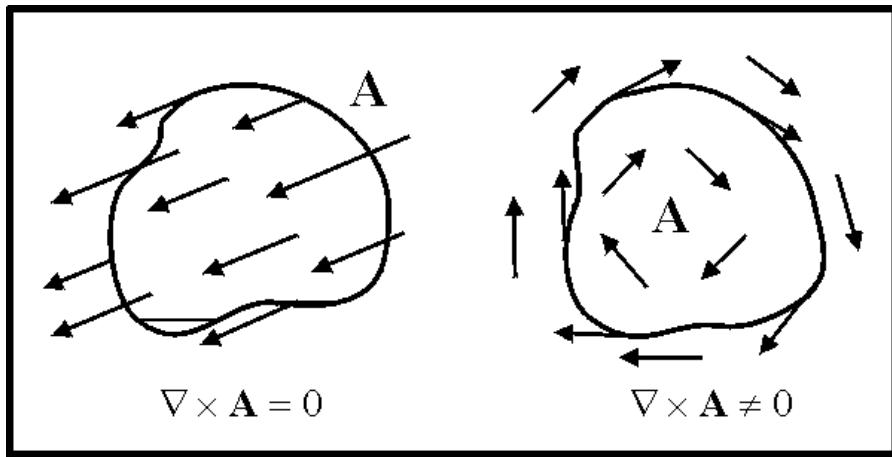

Divergence of a vector field represents the net outward flux per unit volume, i.e. measure of source/sink of flow

# Try yourself later

e.g. check out Khan Academy lectures on divergence, curl

- Take a 2D vector field, e.g.  $\mathbf{v} = \begin{pmatrix} xy \\ y^2 - x^2 \end{pmatrix}$
- Plot the field as vectors on a regular grid
- Calculate  $\nabla \cdot \mathbf{v}$  and plot as a contour plot
- Calculate  $\nabla \times \mathbf{v}$  and plot as contour plot
- What do the different values of divergence and curl mean?

## Curl of a vector field

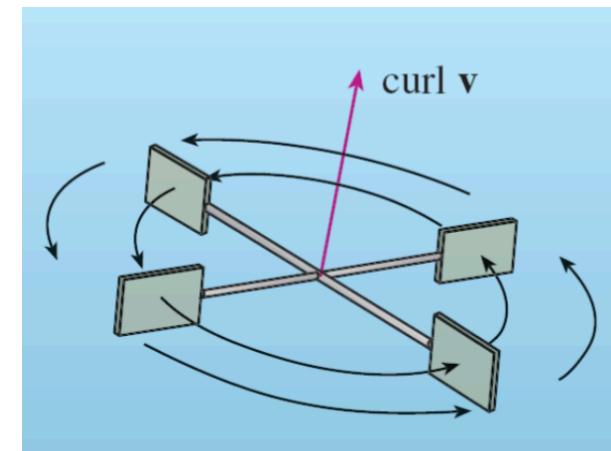

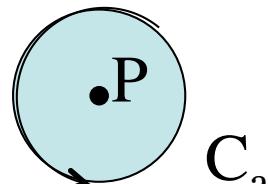

Amount of turn or spin, vorticity, in a vector field

$$\text{Curl theorem: } \int_V \nabla \times \mathbf{v} d\mathbf{x} = \oint_S \mathbf{v} \cdot \hat{\mathbf{t}} ds$$

Right-hand side larger if velocities more parallel to the boundary, spinning in consistent direction, circulation around the boundary

Imagine a very small disk, radius  $a$ , with boundary  $C_a$  around a point  $P$

$$(\nabla \times \mathbf{v})_P \pi a^2 = \oint_{C_a} \mathbf{v} \cdot \hat{\mathbf{t}} ds$$

# Introduction Tensors

- Tensors, generalisation of vectors to more dimensions
- Use when properties depend on direction in more than one way.
- Stress tensor as example
- Stress is force per area, depends on the direction of the force as well as the chosen cross sectional area (which can be described by its normal) on which the stress is evaluated.

# Tensors

## Used in

Stress, strain, moment tensors

Electrostatics, electrodynamics, rotation, crystal properties

**Tensors describe properties that depend on direction**

Tensor rank 0 - scalar - independent of direction

Tensor rank 1 - vector - depends on direction in 1 way

Tensor rank 2 - tensor - depends on direction in 2 ways

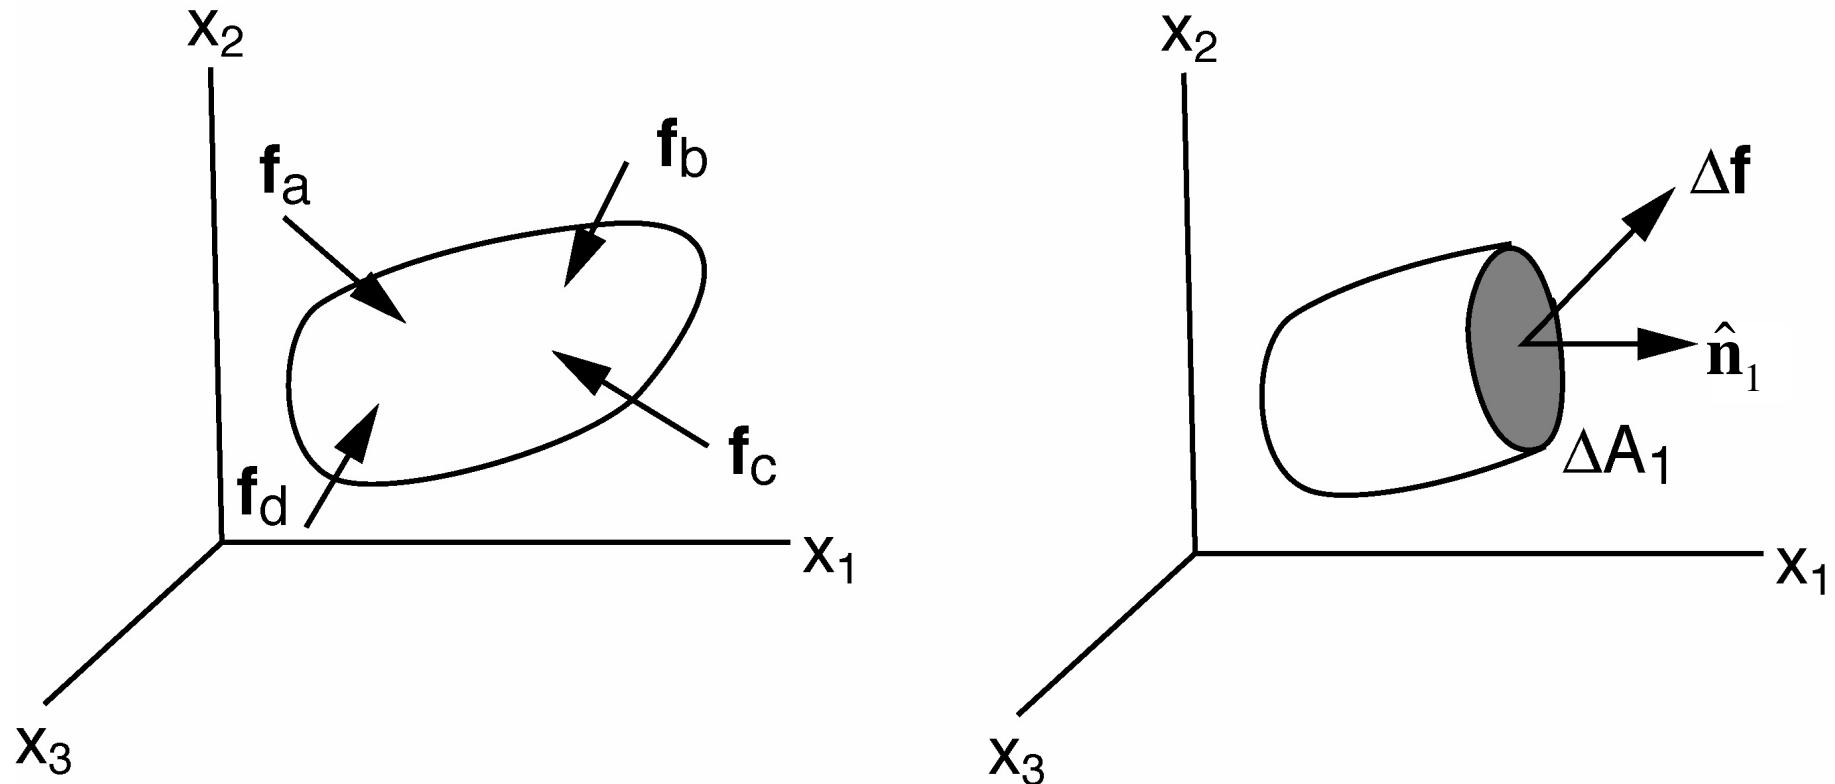

*Tensor comes from the word tension (= stress)*

# Notation

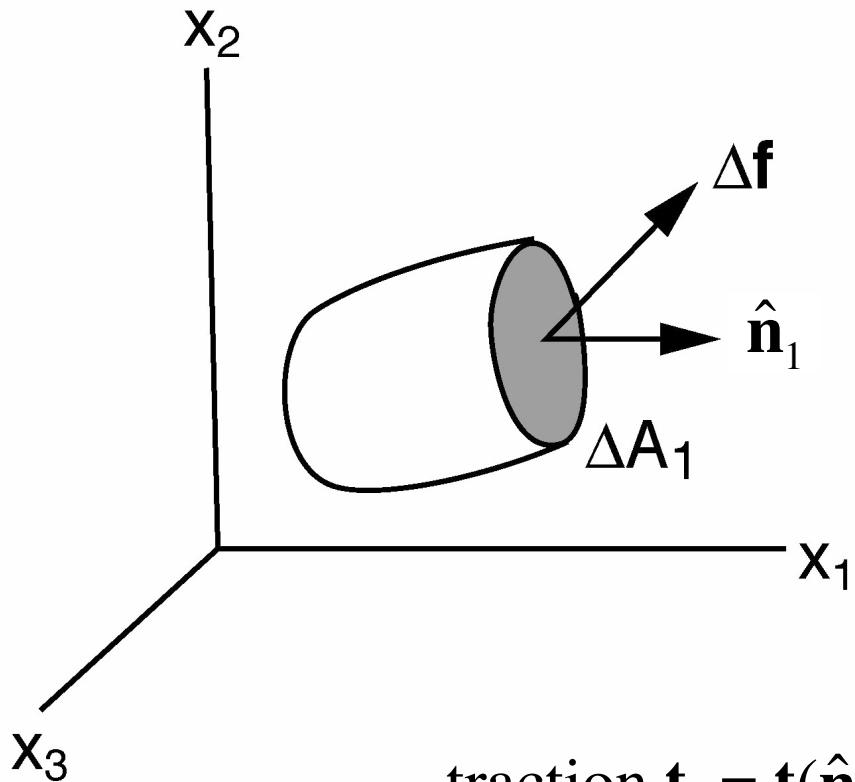

- Tensors as  $\mathbf{T}$
- for second order:  $\overline{\overline{T}}$  or  $\underline{\underline{T}}$
- Index notation  $T_{ij}$ ,  $i,j=x,y,z$  or  $i,j=1,2,3$
- But also higher order  $T_{ijkl}$

# Stress

- *Body forces* - depend on volume, e.g., gravity
- *Surface forces* - depend on surface area, e.g., friction

forces introduce a state of stress in a body

- \$\Delta f\$ necessary to maintain equilibrium depends on orientation of the plane, \$\hat{n}\_1\$

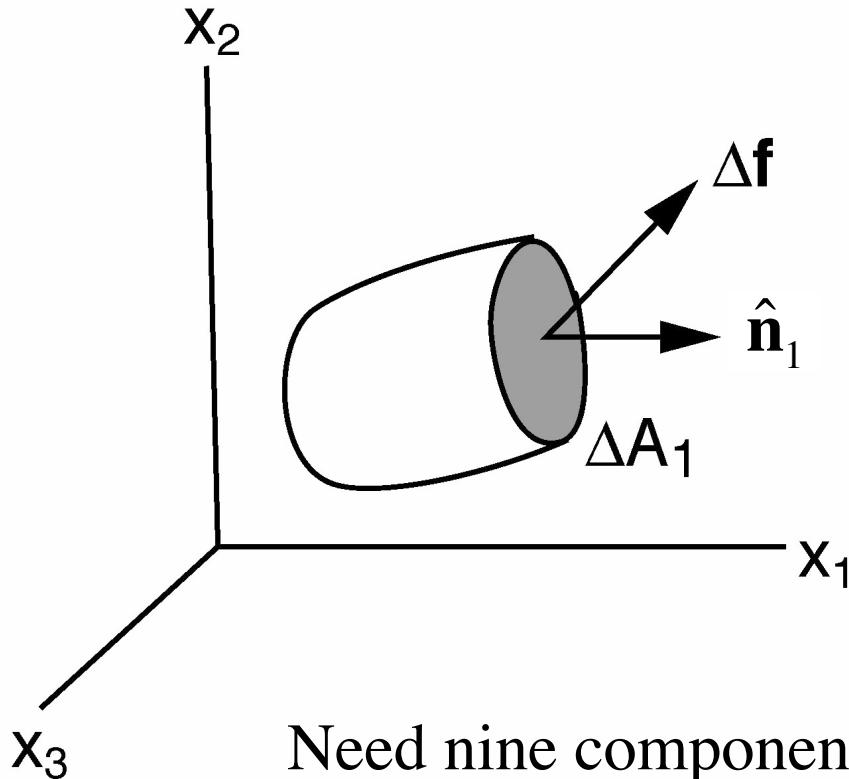

$$\text{traction } \mathbf{t}_1 = \mathbf{t}(\hat{\mathbf{n}}_1) = \lim_{\Delta A \rightarrow 0} \Delta \mathbf{f} / \Delta A_1$$

$$\mathbf{t}_1 = (\sigma_{11}, \sigma_{12}, \sigma_{13})$$

$$\sigma_{11} = \lim_{\Delta A_1 \rightarrow 0} \Delta \mathbf{f}_1 / \Delta A_1$$

$$\sigma_{12} = \lim_{\Delta A_1 \rightarrow 0} \Delta \mathbf{f}_2 / \Delta A_1$$

$$\sigma_{13} = \lim_{\Delta A_1 \rightarrow 0} \Delta \mathbf{f}_3 / \Delta A_1$$

$$\mathbf{t}_1 = \mathbf{t}(\hat{\mathbf{n}}_1) = \lim_{\Delta A \rightarrow 0} \Delta \mathbf{f} / \Delta A_1$$

Need nine components to fully describe the stress

$\sigma_{11}, \sigma_{12}, \sigma_{13}$  for  $\Delta A_1$

$\sigma_{22}, \sigma_{21}, \sigma_{23}$  for  $\Delta A_2$

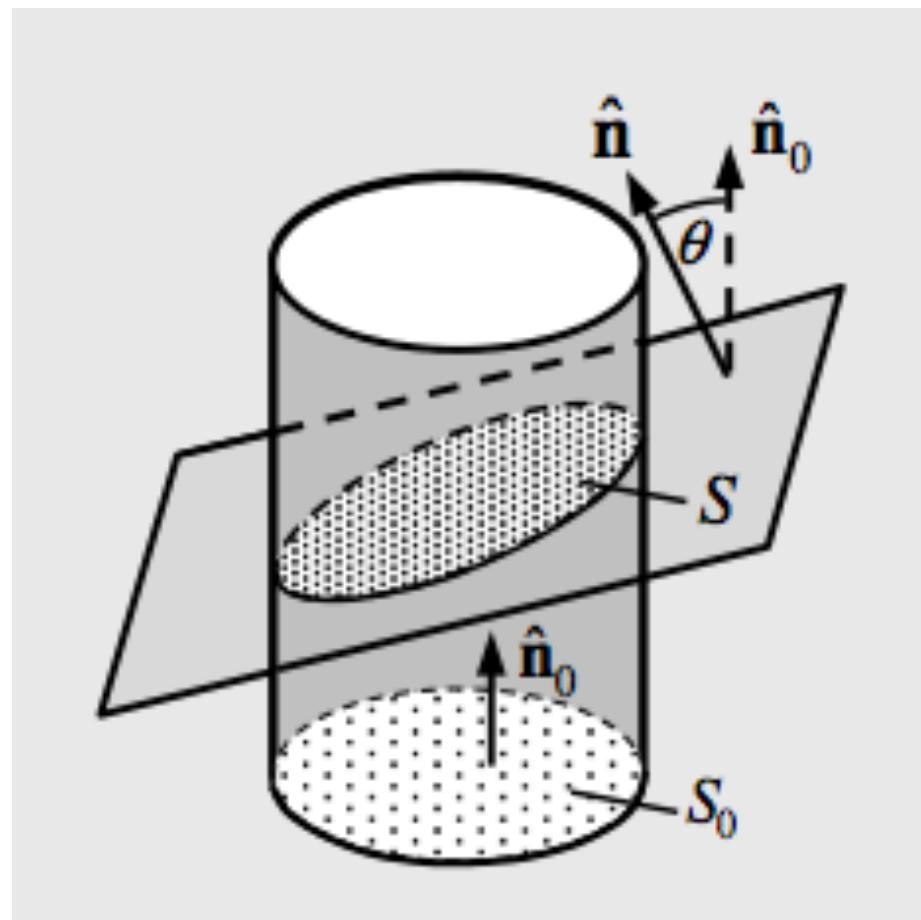

$\sigma_{33}, \sigma_{31}, \sigma_{32}$  for  $\Delta A_3$

first index = orientation of plane

second index = orientation of force

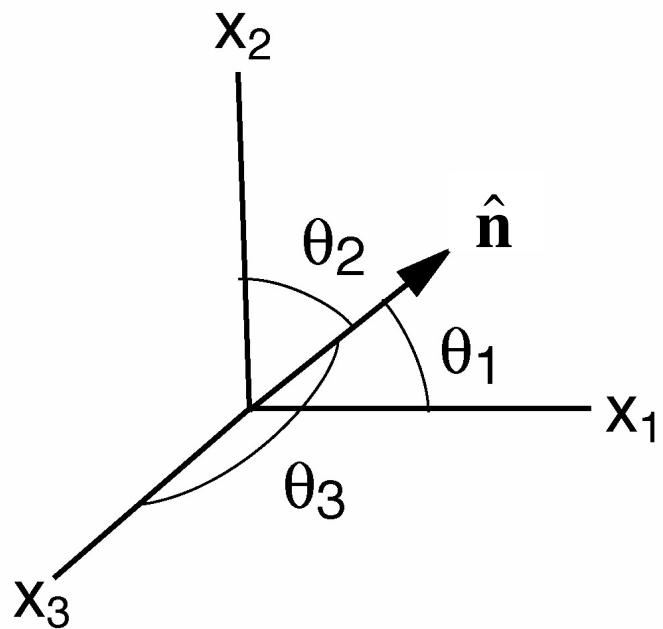

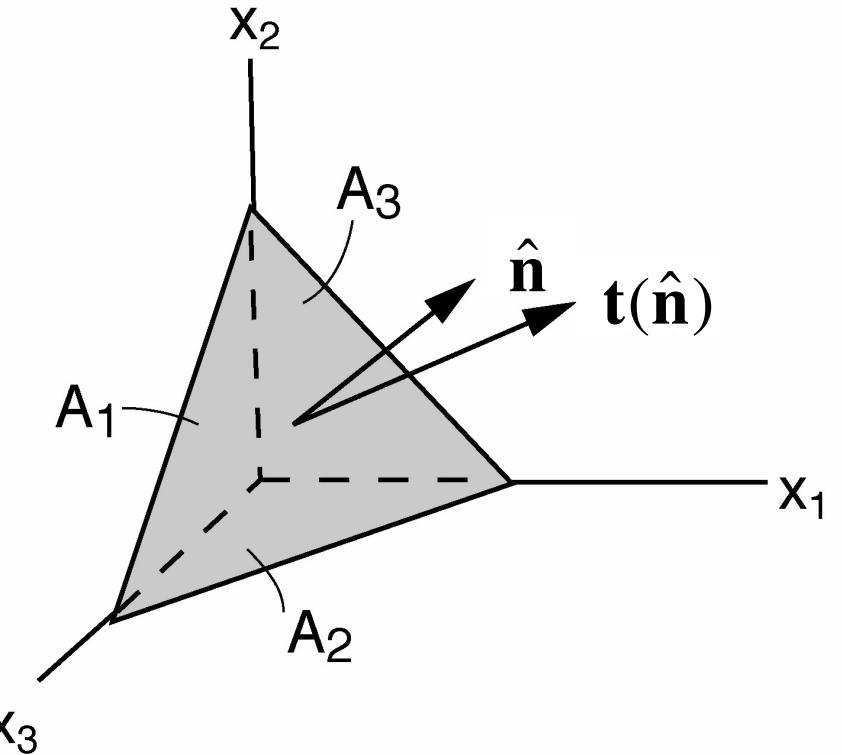

## Try now:

Determine the area of plane  $S$  assuming  $S_0$  and  $\theta$  are known. Use vectors to do this.

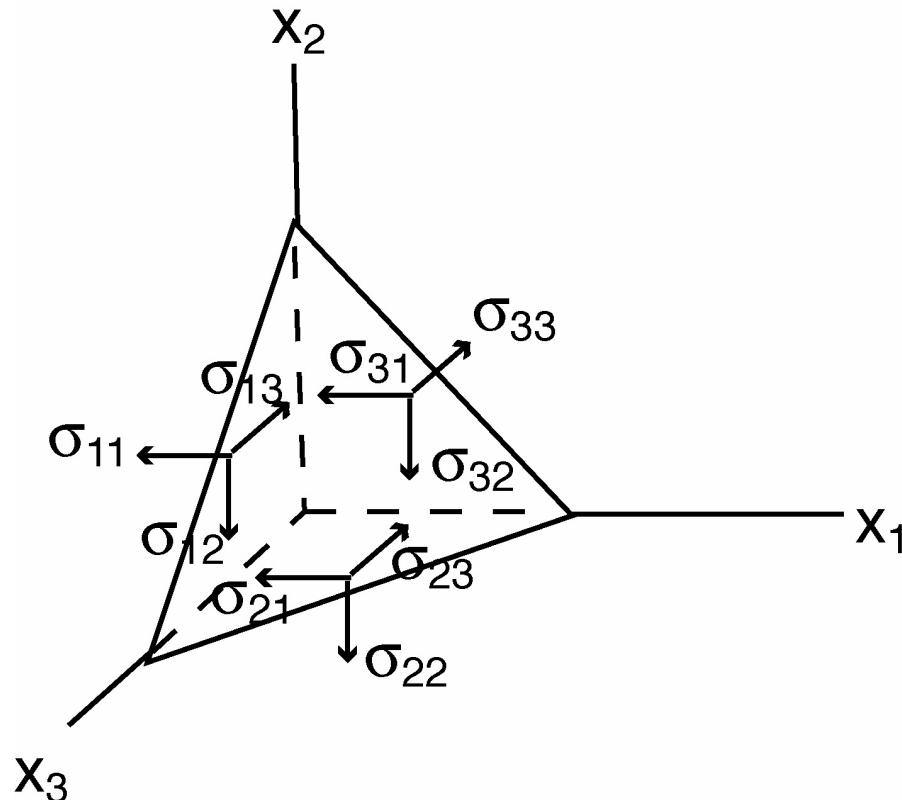

Are nine components sufficient?  
Demonstrate with equilibrium for a  
tetrahedron

Given: stress on  $A_1, A_2, A_3$   
?:  $t(\hat{n})$

- 1:  $\hat{n} = -\hat{x}_1, \Delta A_1 = \Delta A \cos \theta_1$
- 2:  $\hat{n} = -\hat{x}_2, \Delta A_2 = \Delta A \cos \theta_2$
- 3:  $\hat{n} = -\hat{x}_3, \Delta A_3 = \Delta A \cos \theta_3$
- 4:  $\hat{n} = (n_1, n_2, n_3), n_i = \cos \theta_i, \Delta A_4 = \Delta A$

$$\Sigma f_1 = t_1 \Delta A - \sigma_{11} \Delta A \cos \theta_1 - \sigma_{21} \Delta A \cos \theta_2 - \sigma_{31} \Delta A \cos \theta_3 = 0$$

➡  $t_i = \sigma_{ji} n_j$

this gives:

$$t_1 = \sigma_{11} n_1 + \sigma_{21} n_2 + \sigma_{31} n_3$$

similarly:

$$t_2 = \sigma_{12} n_1 + \sigma_{22} n_2 + \sigma_{32} n_3$$

$$t_3 = \sigma_{13} n_1 + \sigma_{23} n_2 + \sigma_{33} n_3$$

(Einstein convention)

*How many stress components required in 2D?*

# Summation (Einstein) convention

When an index in a single term is a duplicate, dummy index, summation implied without writing summation symbol

$$a_1 v_1 + a_2 v_2 + a_3 v_3 = \sum_{i=1}^3 a_i v_i = a_i v_i$$

$$\begin{aligned} \sum_{i=1}^3 \sum_{j=1}^3 a_{ij} x_i y_j &= a_{ij} x_i y_j = a_{11} x_1 y_1 + a_{12} x_1 y_2 + a_{13} x_1 y_3 \\ &\quad + a_{21} x_2 y_1 + a_{22} x_2 y_2 + a_{23} x_2 y_3 \\ &\quad + a_{31} x_3 y_1 + a_{32} x_3 y_2 + a_{33} x_3 y_3 \end{aligned}$$

**Invalid**, indices repeated  
more than twice

$$\sum_{i=1}^3 a_i b_i v_i \neq a_i b_i v_i$$

# Dummy vs free index

$$a_1 v_1 + a_2 v_2 + a_3 v_3 = \sum_{i=1}^3 a_i v_i = \sum_{k=1}^3 a_k v_k$$

- i,k – dummy index – appears in duplicates and can be substituted without changing equation

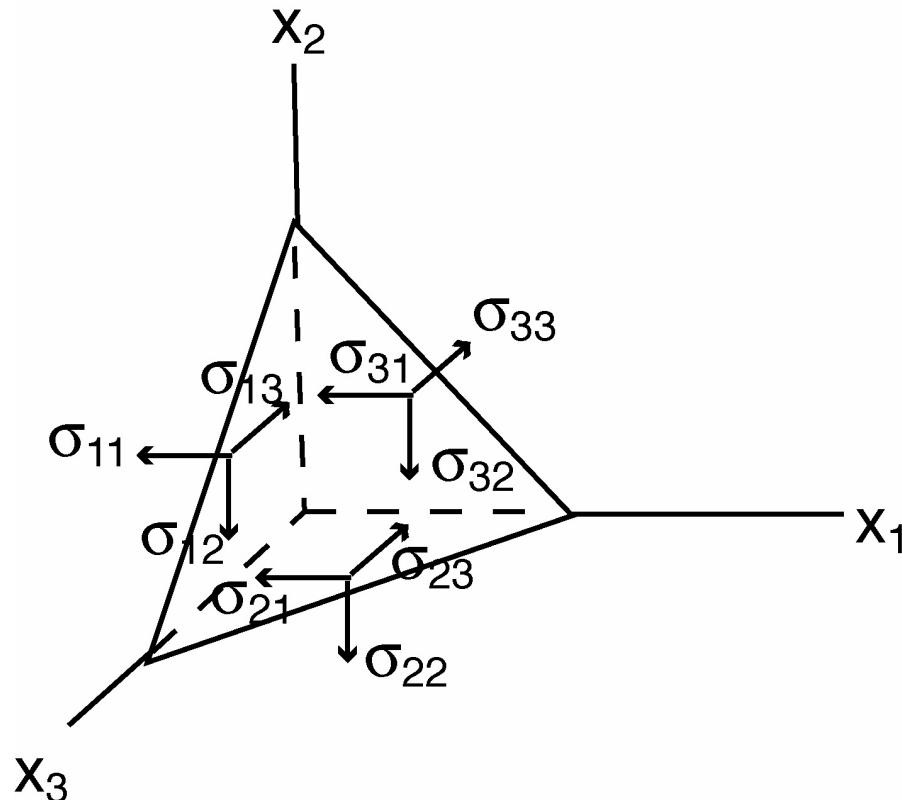

$$F_j = A_j \sum_{i=1}^3 B_i C_i \Rightarrow \begin{aligned} F_1 &= A_1 (B_1 C_1 + B_2 C_2 + B_3 C_3) \\ F_2 &= A_2 (B_1 C_1 + B_2 C_2 + B_3 C_3) \\ F_3 &= A_3 (B_1 C_1 + B_2 C_2 + B_3 C_3) \end{aligned}$$

- j – free index, appears once in each term of the equation

# Index notation questions

1.  $g_k = h_k(2 - 3a_i b_i) - p_j q_j f_k$  - *Which dummy, which free indices, how many equations, how many terms in each?*
2. *Are these valid expressions?*
  - a)  $a_m b_s = c_m (d_r - f_r)$
  - b)  $x_i x_i = r^2$
  - c)  $a_i b_j c_j = 3$

$$\Sigma f_1 = t_1 \Delta A - \sigma_{11} \Delta A \cos \theta_1 - \sigma_{21} \Delta A \cos \theta_2 - \sigma_{31} \Delta A \cos \theta_3 = 0$$

➡  $t_i = \sigma_{ji} n_j$

this gives:

$$t_1 = \sigma_{11} n_1 + \sigma_{21} n_2 + \sigma_{31} n_3$$

similarly:

$$t_2 = \sigma_{12} n_1 + \sigma_{22} n_2 + \sigma_{32} n_3$$

$$t_3 = \sigma_{13} n_1 + \sigma_{23} n_2 + \sigma_{33} n_3$$

(Einstein convention)

*How many stress components required in 2D?*

$$t_i = \sigma_{ji} n_j$$

$$t = \underline{\sigma}^T \cdot \hat{n}$$

Transpose:  $\sigma_{ji} = \sigma_{ij}^T$

Note: unusual index order

in matrix notation:  $t = \begin{bmatrix} \sigma_{11} & \sigma_{21} & \sigma_{31} \\ \sigma_{12} & \sigma_{22} & \sigma_{32} \\ \sigma_{13} & \sigma_{23} & \sigma_{33} \end{bmatrix} \cdot \hat{n}$

$t$  and  $\hat{n}$  - tensors of rank 1 (vectors) in 3-D

$\underline{\sigma}$  - tensor of rank 2 in 3-D

compression - negative  
tension - positive

$\sigma_{ji}$  where  $i=j$  - normal stresses  
 $\sigma_{ji}$  where  $i \neq j$  - shear stresses

*2<sup>nd</sup> order tensors can be written as square matrices and have algebraic properties similar to some of those of matrices.*

# Addition and subtraction of tensors

$$\mathbf{W} = a\mathbf{T} + b\mathbf{S}$$

$$\text{add each component: } W_{ijkl} = aT_{ijkl} + bS_{ijkl}$$

**T** and **S** must have same rank, dimension and units  
**W** has same rank, dimension and units as **T** and **S**

**T** and **S** are tensors  $\Rightarrow$  **W** is a tensor

commutative, associative

*This is same as how vectors and matrices are added.*

# Multiplication of tensors

Inner product = dot product

$$\mathbf{W} = \mathbf{T} \cdot \mathbf{S}$$

involves contraction over 1 index:  $W_{ik} = T_{ij}S_{jk}$

As normal matrix and matrix-vector multiplication

$\mathbf{T}$  and  $\mathbf{S}$  can have different rank, but same dimension

rank  $\mathbf{W}$  = rank  $\mathbf{T}$  + rank  $\mathbf{S}$  - 2, dimension as  $\mathbf{T}$  and  $\mathbf{S}$ ,  
units as product of units  $\mathbf{T}$  and  $\mathbf{S}$

$\mathbf{T}$  and  $\mathbf{S}$  are tensors  $\Rightarrow \mathbf{W}$  is a tensor

Examples:  $|\mathbf{v}|^2 = \mathbf{v} \cdot \mathbf{v}$

$\boldsymbol{\sigma} = \mathbf{C} : \boldsymbol{\epsilon}$  or  $\sigma_{ij} = C_{ijkl} \epsilon_{kl}$  (Hooke's law)

# Multiplication of tensors

Tensor product=outer product = dyadic product  
≠ cross product

$\mathbf{W} = \mathbf{T}\mathbf{S}$  sometimes written as  $\mathbf{W} = \mathbf{T} \otimes \mathbf{S}$

no contraction:  $W_{ijkl} = T_{ij}S_{kl}$

$\mathbf{T}$  and  $\mathbf{S}$  can have different rank, but same dimension  
rank $\mathbf{W}$  = rank $\mathbf{T}$ +rank $\mathbf{S}$ , dimension as  $\mathbf{T}$  and  $\mathbf{S}$ ,  
units as product of units  $\mathbf{T}$  and  $\mathbf{S}$

$\mathbf{T}$  and  $\mathbf{S}$  are tensors  $\Rightarrow \mathbf{W}$  is a tensor

Examples:  $\nabla\mathbf{v}$  (gradient of a vector)  $\neq \nabla \cdot \mathbf{v}$  (divergence)

*remember gradient is a vector*    $\nabla = \left( \frac{\partial}{\partial x_1}, \frac{\partial}{\partial x_2}, \frac{\partial}{\partial x_3} \right)$

# Multiplication of tensors

For both multiplications

Distributive:  $\mathbf{A}(\mathbf{B}+\mathbf{C})=\mathbf{AB}+\mathbf{AC}$

Associative:  $\mathbf{A}(\mathbf{BC})=(\mathbf{AB})\mathbf{C}$

Not commutative:  $\mathbf{TS} \neq \mathbf{ST}$ ,  $\mathbf{T}\cdot\mathbf{S} \neq \mathbf{S}\cdot\mathbf{T}$

but:  $\mathbf{T}\cdot\mathbf{S}=\mathbf{S}^T\cdot\mathbf{T}^T$

and:  $\mathbf{ab}=(\mathbf{ba})^T$  but only for rank 2

Remember transpose:  $\mathbf{a}\cdot\mathbf{T}\cdot\mathbf{b}=\mathbf{b}\cdot\mathbf{T}^T\cdot\mathbf{a} \Rightarrow \mathbf{T}_{ji}=\mathbf{T}_{ij}^T$

## Special tensor: Kronecker delta $\delta_{ij}$

$$\delta_{ij} = \hat{\mathbf{e}}_i \cdot \hat{\mathbf{e}}_j$$

$\delta_{ij} = 1$  for  $i=j$ ,  $\delta_{ij} = 0$  for  $i \neq j$

In 3-D:

$$\delta = \mathbf{I} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{T} \cdot \delta = \mathbf{T} \cdot \mathbf{I} = \mathbf{T} \quad \text{or} \quad T_{ij}\delta_{jk} = T_{ik}$$

Isotropic tensors,  
invariant upon  
coordinate  
transformation

- Scalars
- $\mathbf{0}$  vector
- $\delta_{ij}$

$\delta$  is isotropic:  $\delta_{ij} = \delta'_{ij}$  upon coordinate transformation  
 can be used to write dot product:  $T_{ij}S_{jl} = T_{ij}S_{kl}\delta_{jk}$   
 can be used to write trace:  $A_{ii} = A_{ij}\delta_{ij}$   
 orthonormal transformation:  $l_{ij}l^T_{jk} = \delta_{ik}$

## Special tensor: Permutation symbol $\epsilon_{ijk}$

$$\epsilon_{ijk} = (\hat{\mathbf{e}}_i \times \hat{\mathbf{e}}_j) \cdot \hat{\mathbf{e}}_k$$

$\epsilon_{ijk} = 1$  if  $i,j,k$  an even permutation of 1,2,3

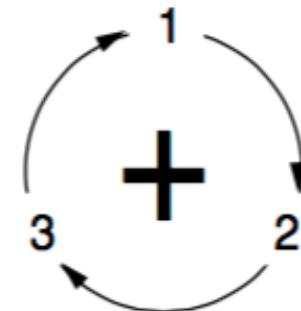

$\epsilon_{ijk} = -1$  if  $i,j,k$  an odd permutation of 1,2,3

$\epsilon_{ijk} = 0$  for all other  $i,j,k$

$$\epsilon_{123} = \epsilon_{231} = \epsilon_{312} = 1$$

$$\epsilon_{213} = \epsilon_{321} = \epsilon_{132} = -1$$

$$\epsilon_{111} = \epsilon_{112} = \epsilon_{222} = \dots = 0$$

Note that  $\epsilon_{ijk} a_i b_j \hat{\mathbf{e}}_k$  where  $\hat{\mathbf{e}}_k$  is the unit vector in k direction  
is index notation for cross product  $\mathbf{a} \times \mathbf{b}$

**Exercise:** useful identity  $\epsilon_{ijm} \epsilon_{klm} = \delta_{ik} \delta_{jl} - \delta_{il} \delta_{jk}$

Cross product of two vectors:

Vector Notation	Index Notation
$\vec{a} \times \vec{b} = \vec{c}$	$\epsilon_{ijk} a_j b_k = c_i$

Try  
yourself  
later

Recall that

$$(a_1, a_2, a_3) \times (b_1, b_2, b_3) = (a_2 b_3 - a_3 b_2, a_3 b_1 - a_1 b_3, a_1 b_2 - a_2 b_1)$$

Now, note that the notation  $\epsilon_{ijk} a_j b_k$  represents three terms, the first of which is

$$\epsilon_{1jk} a_j b_k =$$

=

$$= \epsilon_{123} a_2 b_3 + \epsilon_{132} a_3 b_2$$

$$= a_2 b_3 - a_3 b_2$$

# Vector derivatives - curl

$$\text{Curl of a vector: } \nabla \times \mathbf{v} = \epsilon_{ijk} \frac{\partial}{\partial x_i} v_j \hat{\mathbf{e}}_k = \begin{pmatrix} \frac{\partial v_3}{\partial x_2} - \frac{\partial v_2}{\partial x_3} \\ \frac{\partial v_1}{\partial x_3} - \frac{\partial v_3}{\partial x_1} \\ \frac{\partial v_2}{\partial x_1} - \frac{\partial v_1}{\partial x_2} \end{pmatrix}$$

In index notation, using special tensor

# Some tensor calculus

Gradient of a vector is a tensor:

$$\nabla \mathbf{v} = \frac{\partial v_j}{\partial x_i} = \begin{bmatrix} \frac{\partial v_1}{\partial x_1} & \frac{\partial v_2}{\partial x_1} & \frac{\partial v_3}{\partial x_1} \\ \frac{\partial v_1}{\partial x_2} & \frac{\partial v_2}{\partial x_2} & \frac{\partial v_3}{\partial x_2} \\ \frac{\partial v_1}{\partial x_3} & \frac{\partial v_2}{\partial x_3} & \frac{\partial v_3}{\partial x_3} \end{bmatrix}$$

Divergence of a vector:

$$\nabla \cdot \mathbf{v} = \frac{\partial v_i}{\partial x_i} = \frac{\partial v_1}{\partial x_1} + \frac{\partial v_2}{\partial x_2} + \frac{\partial v_3}{\partial x_3}$$

$$\nabla \cdot \mathbf{v} = \text{tr}(\nabla \mathbf{v})$$

Trace of a tensor is the sum of diagonal elements

# Some tensor calculus

Divergence of a tensor:

$$\nabla \cdot T = \frac{\partial T_{ij}}{\partial x_i} = \begin{pmatrix} \frac{\partial T_{i1}}{\partial x_i} \\ \frac{\partial T_{i2}}{\partial x_i} \\ \frac{\partial T_{i3}}{\partial x_i} \end{pmatrix} = \begin{pmatrix} \frac{\partial T_{11}}{\partial x_1} + \frac{\partial T_{21}}{\partial x_2} + \frac{\partial T_{31}}{\partial x_3} \\ \frac{\partial T_{12}}{\partial x_1} + \frac{\partial T_{22}}{\partial x_2} + \frac{\partial T_{32}}{\partial x_3} \\ \frac{\partial T_{13}}{\partial x_1} + \frac{\partial T_{23}}{\partial x_2} + \frac{\partial T_{33}}{\partial x_3} \end{pmatrix}$$

Laplacian =  $\text{div}(\text{grad } f)$ , where  $f$  is a scalar function

$$\nabla \cdot \nabla f = \nabla^2 f = \Delta f = \frac{\partial^2 f}{\partial x_i \partial x_i} = \frac{\partial f}{\partial x_1^2} + \frac{\partial f}{\partial x_2^2} + \frac{\partial f}{\partial x_3^2}$$

# Summary

- **Vectors**
  - Addition, linear independence
  - Orthonormal Cartesian bases, transformation
  - Multiplication
  - Derivatives, del, div, curl
- **Tensors**
  - Tensors, rank, stress tensor
  - Index notation, summation convention
  - Addition, multiplication
  - Special tensors,  $\delta_{ij}$  and  $\epsilon_{ijk}$
  - Tensor calculus: gradient, divergence, curl, ..
